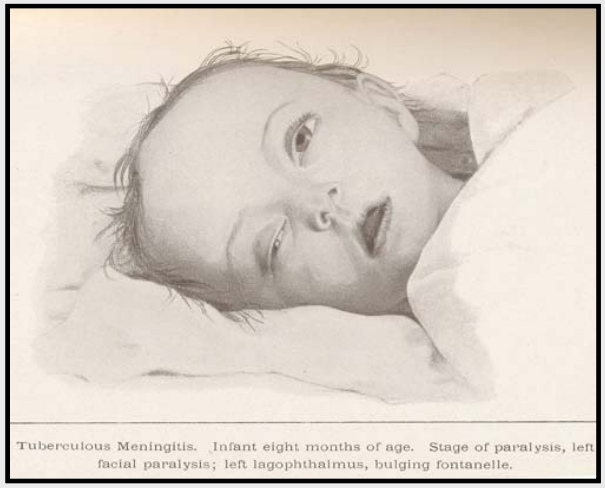
Population Pharmacokinetics of Isoniazid in Children with Tuberculous Meningitis

Thanaporn Wattanakul, Thomas Pouplin,
Toi Pham Van, Nicholas Day, Nicholas White,
Jeremy Day, Jeremy Farrar, Joel Tarning



Tuberculous Meningitis. Infant eight months of age. Stage of paralysis, left facial paralysis; left lagophthalmus, bulging fontanelle.

Outline

- Background
- Anti-tuberculosis drugs
- Objective
- Methods
- Pharmacokinetics of Isoniazid
- Planning for further study
- Conclusions
- Acknowledgement

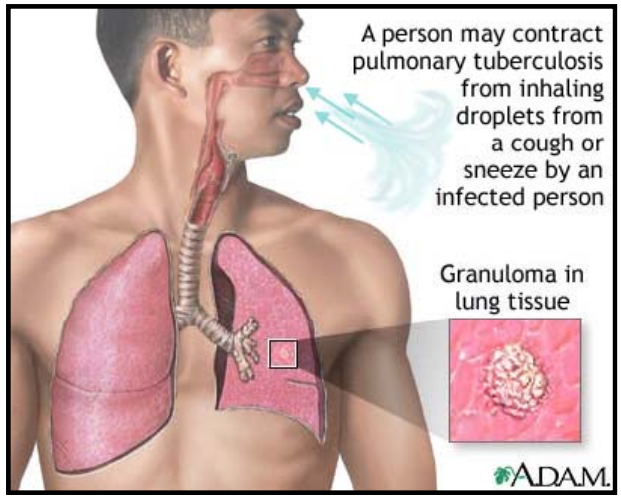
Background

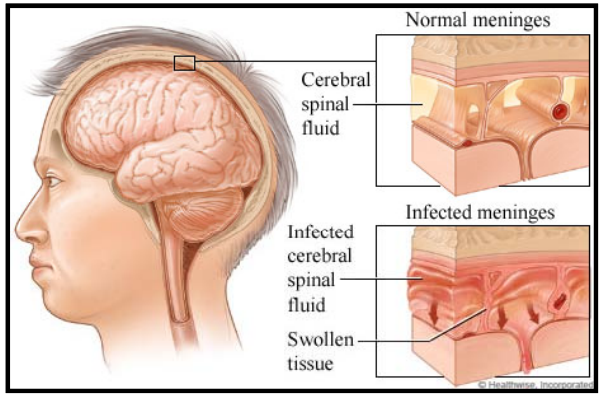
Tuberculosis

- Tuberculosis caused by *Mycobacterium tuberculosis*
- Airborne transmission
- Pulmonary tuberculosis
- Extrapulmonary tuberculosis (e.g. lymph nodes, skeletons, meninges)

Tuberculous meningitis (TBM)

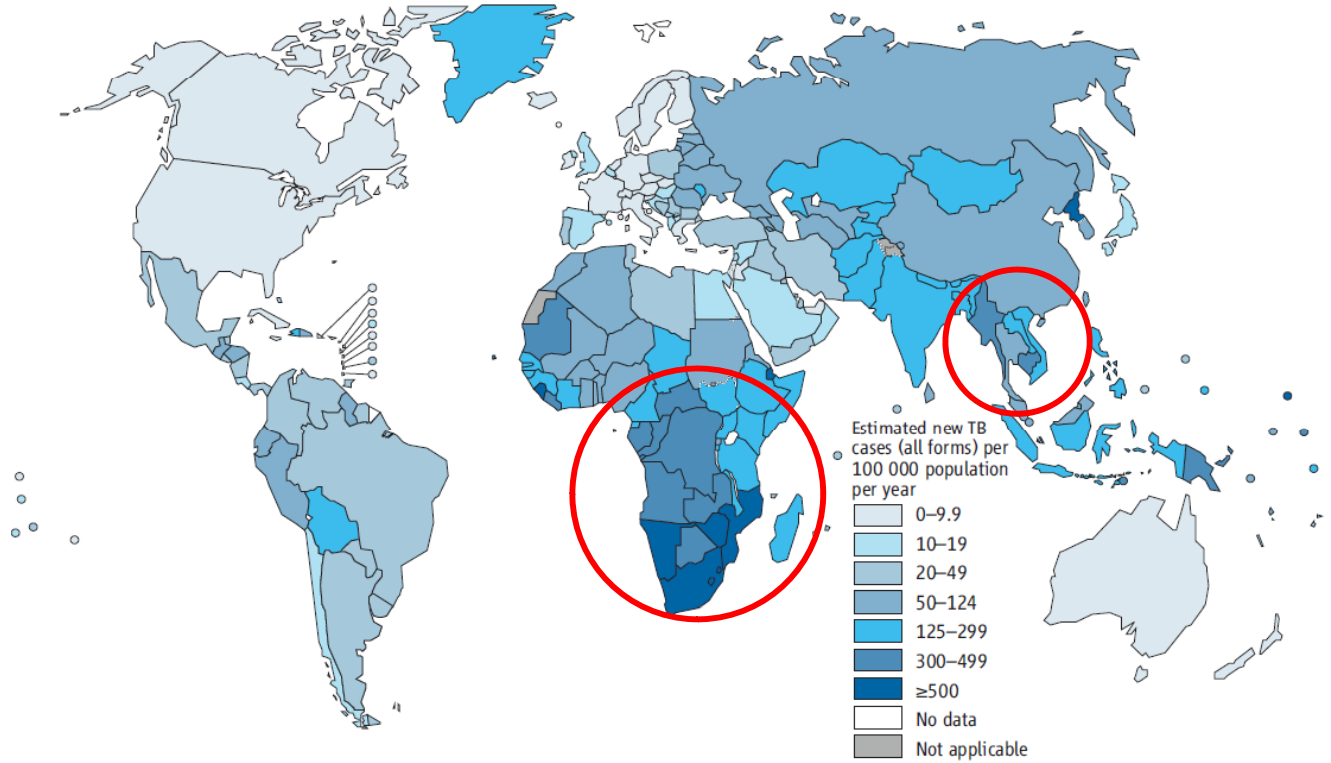
- The most common form of tuberculosis in the central nervous system
- Most often occur in young children but also found in adult, especially in HIV infected patients





Background

WHO estimated tuberculosis incidence rates,2012



- The incidence of tuberculosis among children was estimated at **530,000** cases, equivalent to about **6% of the total number of 8.6 million** incident cases in 2012
- Children aged <1 year has 10-20% risk of developing TBM after primary infection
- Early diagnosis and treatment are crucial to reduce the mortality

Anti-tuberculosis drugs

- Children with suspected or confirmed pulmonary tuberculosis

Isoniazid (H)
Rifampicin (R)
Pyrazinamide (Z)
Ethambutol (E)
2 months

→

Isoniazid (H)
Rifampicin (R)
4 months

- Children with suspected or confirmed tuberculous meningitis

Isoniazid (H)
Rifampicin (R)
Pyrazinamide (Z)
Ethambutol (E)
2 months

→

Isoniazid (H)
Rifampicin (R)
10 months

Anti-tuberculosis drugs

- Isoniazid is one of the essential first-line anti-tuberculosis agents that have a rapid early bactericidal activity

- Isoniazid is a lipophilic small molecule and considered to be the ideal agent for TBM treatment since it easily cross the blood-brain-barrier to the site of action

- Complex pharmacokinetic properties;
  - Polymorphic elimination (N-acetyltransferase 2, *NAT2*)
  - First-pass metabolism

- The information about pharmacokinetic properties of isoniazid in children with TBM is limited

Objective

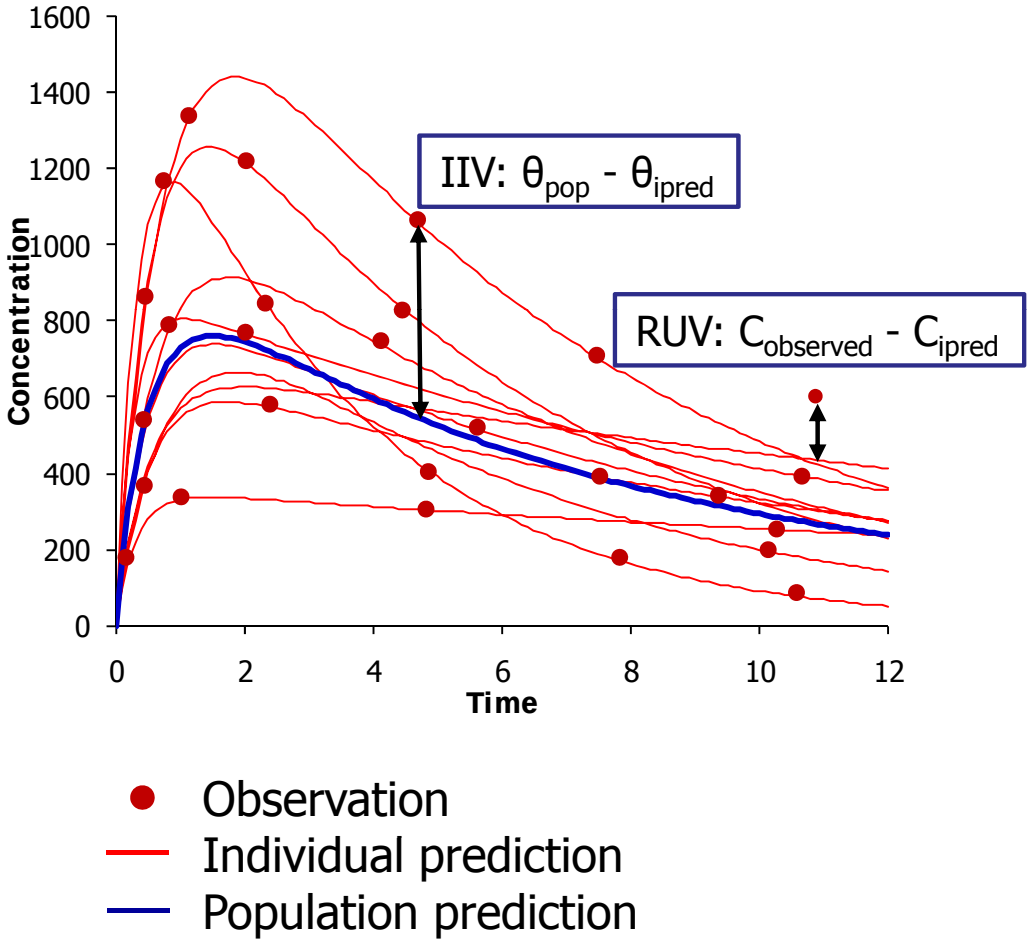
To investigate the pharmacokinetics of isoniazid in children with TBM

- 99 Vietnamese children with confirmed or suspected TBM
- Age from 2 months to 15 years
- Fixed dose combination tablet of isoniazid, rifampicin, and pyrazinamide + extra tablet for ethambutol
- Sparse sampling schedule at random time points
  - 4 plasma samples /patient
  - 2 cerebrospinal fluid (CSF) samples /patient

	Number of observations per patient			
Sample	DAY 1	DAY 14	DAY 30	DAY 90
Plasma	2	2	1	1
CSF	-	-	1	1

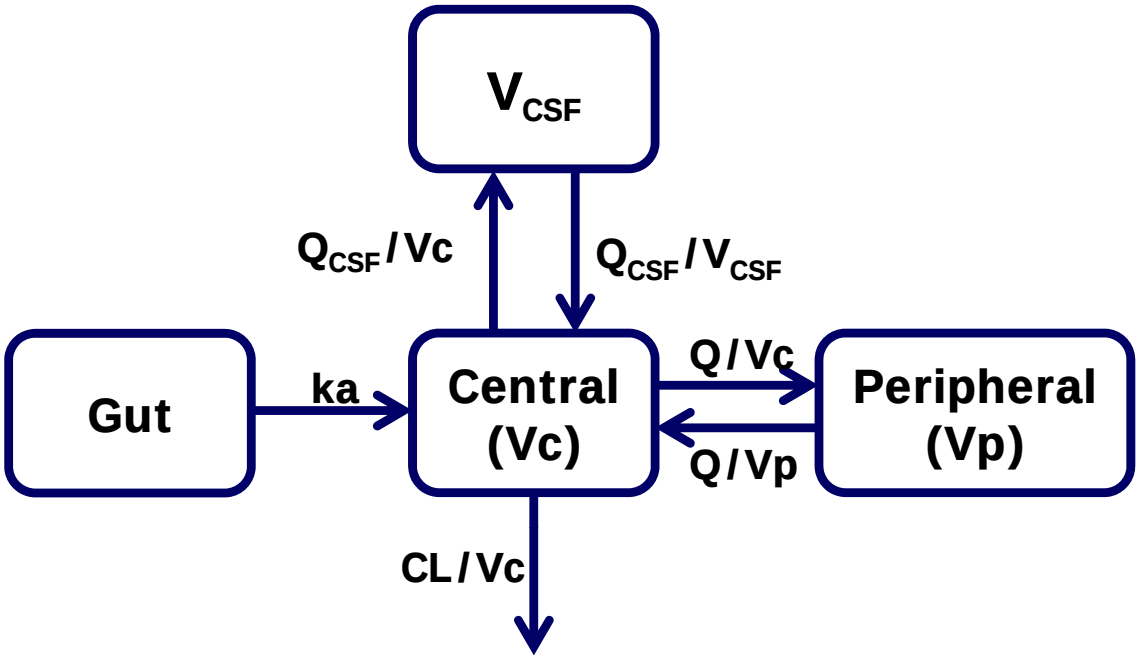
Methods

Nonlinear mixed-effects modeling



- Structural model
  - Absorption model
  - Distribution model
- Statistical model
  - Inter-individual variability
  - Residual unexplained variability
- Covariate model
  - Relationship between pharmacokinetic parameters and patient's demographic data (e.g. body weight, age)

Pharmacokinetics of Isoniazid



Maturation effect

$$MF = \frac{Age^{hill}}{AG50^{hill} + Age^{hill}}$$

Allometric scaling

$$CL = CL_{std} \times \left(\frac{WT}{WT_{median}}\right)^{0.75}$$

- 2-compartment distribution model for plasma
- 1-compartment distribution model for CSF
- The allometry was used to describe the PK parameter in children
- Clearance of isoniazid increased over time (increased by 30% in 48 h)
- Maturation of *NAT2* enzyme which influence isoniazid clearance complete during the 1st year of life.

Pharmacokinetics of Isoniazid

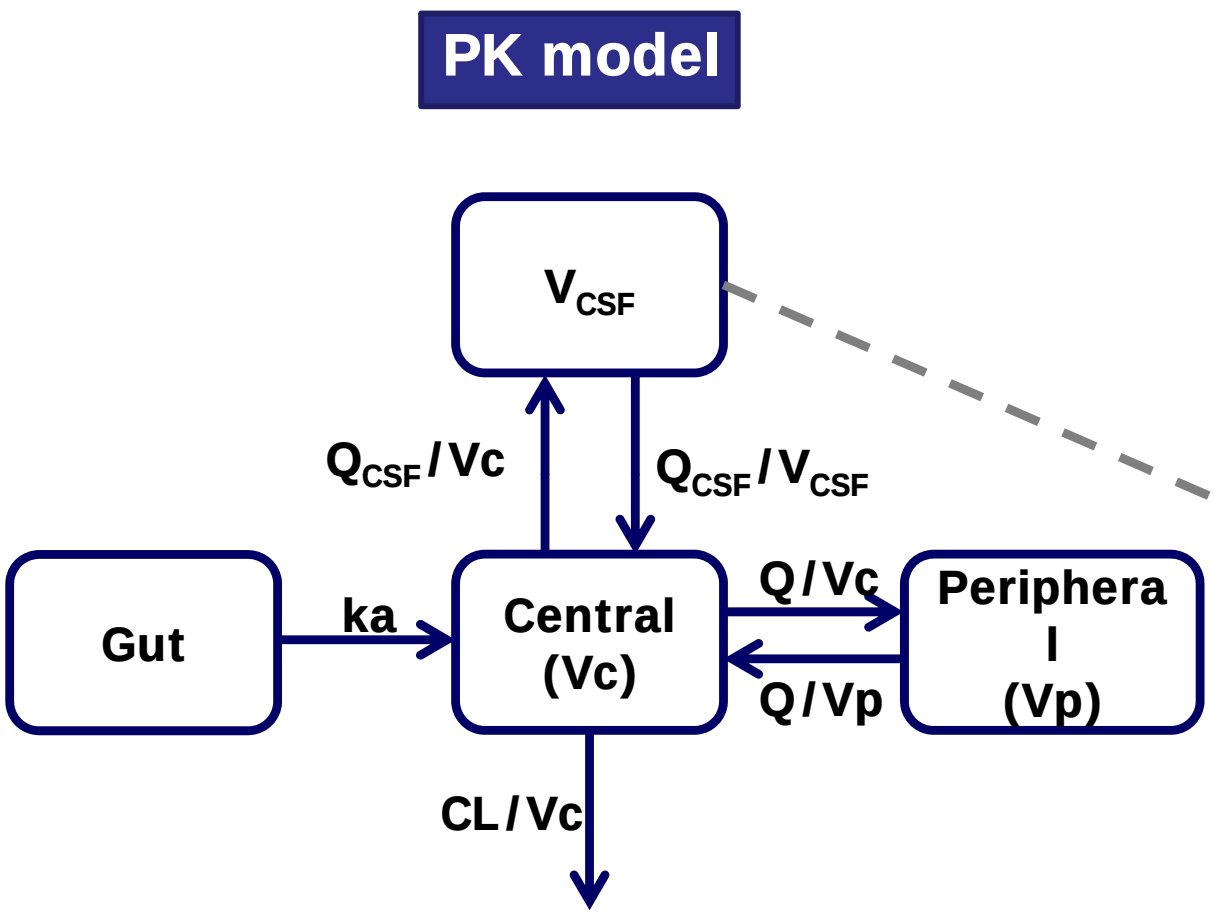
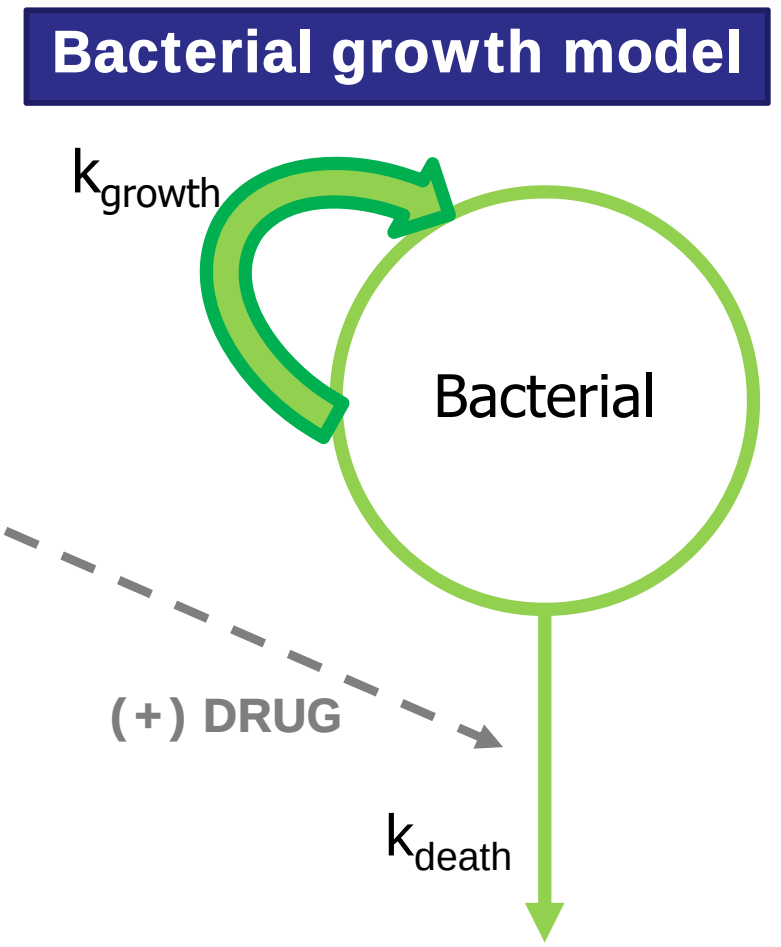
Planning for further study





Information from literatures

Conclusions

- Pharmacokinetics of isoniazid in children with TBM successfully described by
  - 2-compartment distribution model for plasma
  - 1-compartment distribution model for CSF
- Allometric function of body weight was used to describe the pharmacokinetic parameter.
- The increase of isoniazid clearance over time may be partly explained by improvement of organ function.
- Maturation of *NAT2* enzyme was completed during the early stage of life.
- The link between pharmacokinetics model of isoniazid and bacterial growth model is a worth investigation.
