Cheaper cost of DNA sequencing makes it possible to sequence more

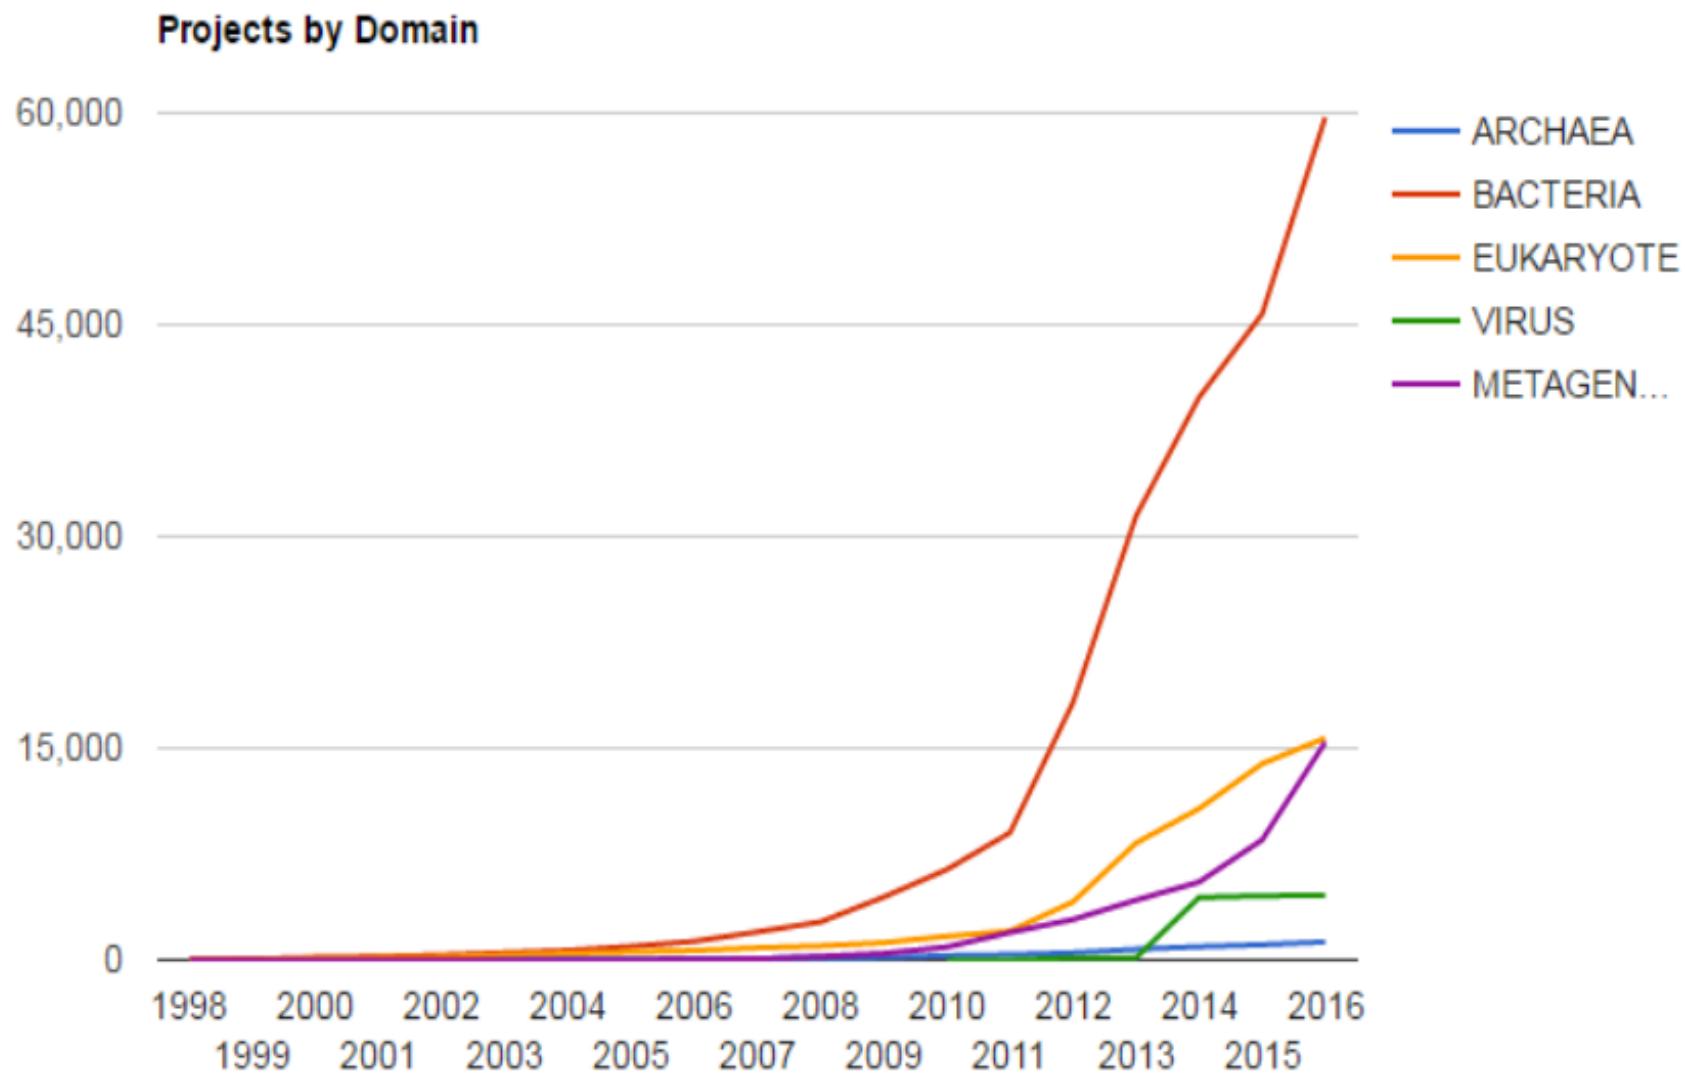

Decline in real costs compared to expected declines based on Moore's Law.

Trend line: Cost per human genome. Line width: Cost per megabase (Mb)

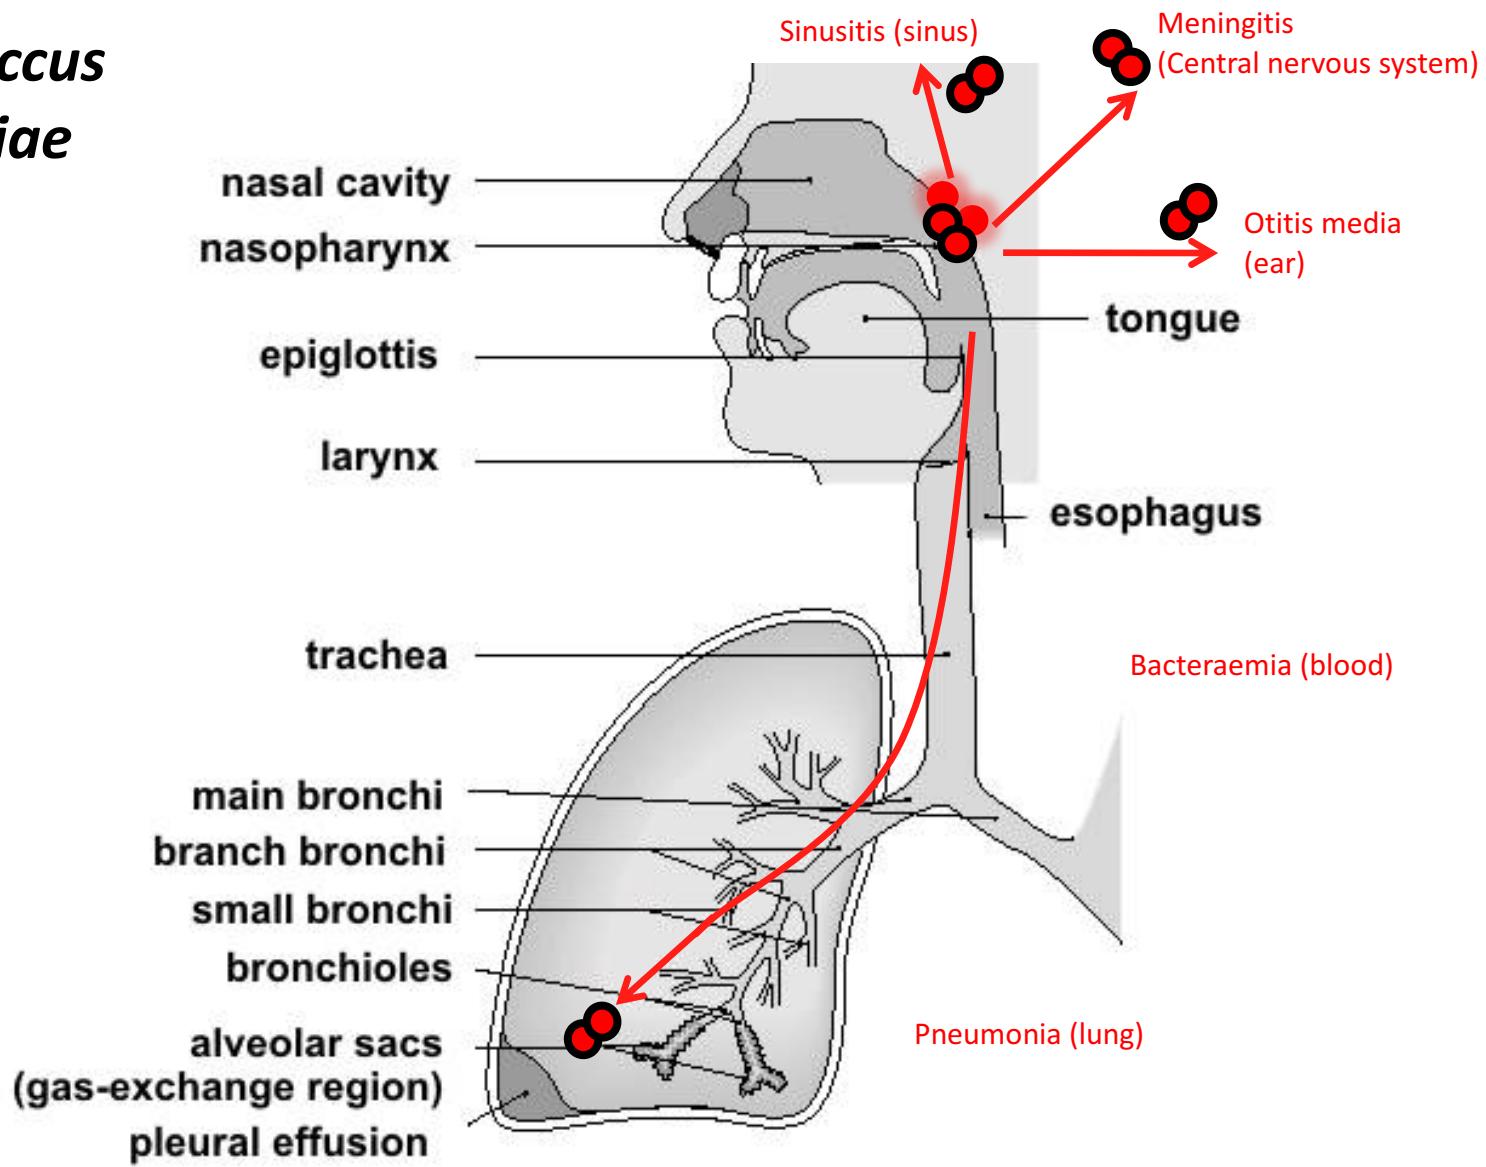

(Data: NHGRI <https://www.genome.gov/27541954/dna-sequencing-costs-data/>)

An exponential increase in projects employing next generation sequencing

Source: NCBI Gold

Streptococcus pneumoniae

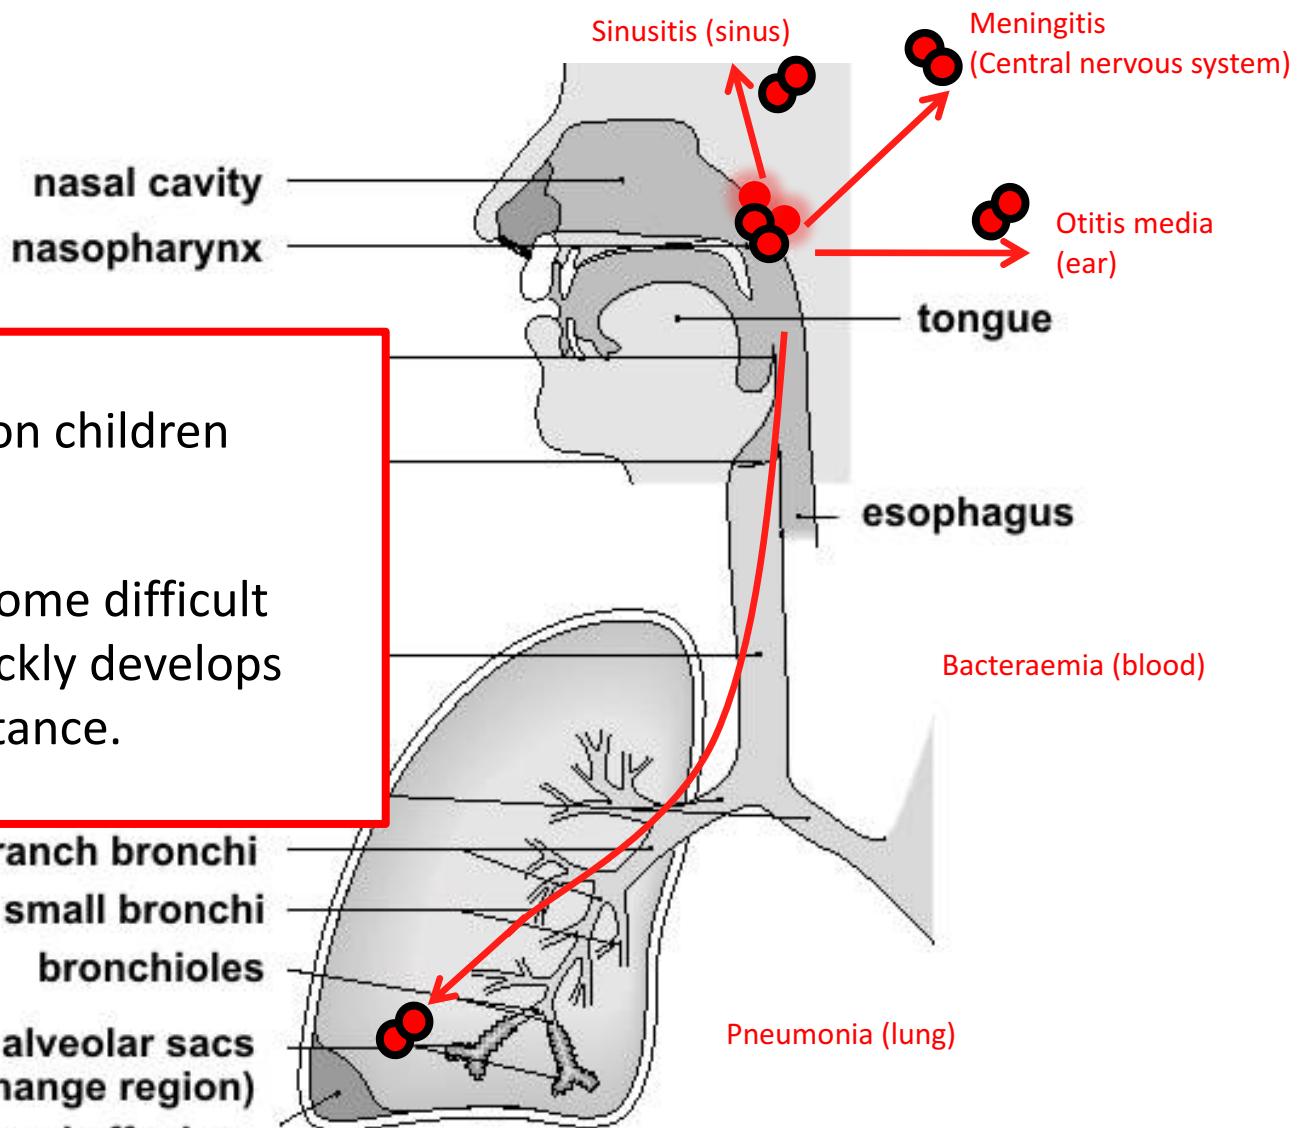

Streptococcus pneumoniae

A killer of 1.2 million children annually.

Treatment has become difficult as the bacteria quickly develops antimicrobial resistance.

branch bronchi
small bronchi
bronchioles
alveolar sacs
(gas-exchange region)
pleural effusion

WHO priority pathogens list for R&D of new antibiotics

Priority 1: CRITICAL

1. *Acinetobacter baumannii*, carbapenem-resistant
2. *Pseudomonas aeruginosa*, carbapenem-resistant
3. *Enterobacteriaceae*, carbapenem-resistant, ESBL-producing

Priority 2: HIGH

1. *Enterococcus faecium*, vancomycin-resistant
2. *Staphylococcus aureus*, methicillin-resistant, vancomycin-intermediate and resistant
3. *Helicobacter pylori*, clarithromycin-resistant
4. *Campylobacter* spp., fluoroquinolone-resistant
5. *Salmonellae*, fluoroquinolone-resistant
6. *Neisseria gonorrhoeae*, cephalosporin-resistant, fluoroquinolone-resistant

Priority 3: MEDIUM

1. *Streptococcus pneumoniae*, penicillin-non-susceptible
2. *Haemophilus influenzae*, ampicillin-resistant
3. *Shigella* spp., fluoroquinolone-resistant

Streptococcus pneumoniae collection

Paul Turner MD

Claudia Turner MD

Myanmar

Thailand

Maela refugee camp: Approx 40,000 Karen refugees, Approx 2.4 km²

Streptococcus pneumoniae collection

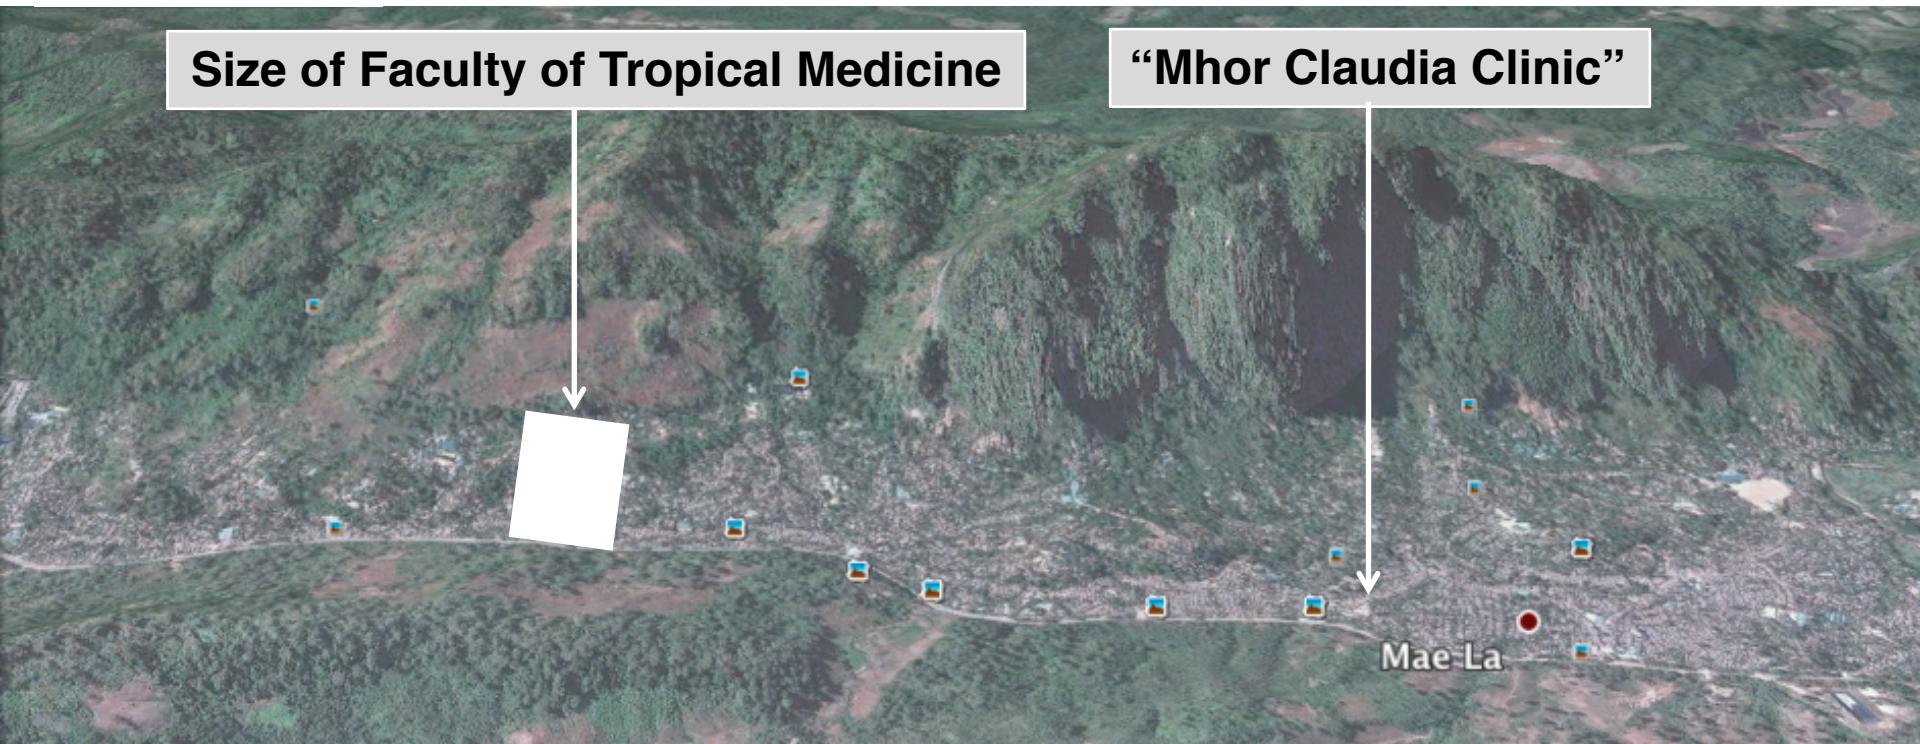

Paul Turner MD

Claudia Turner MD

3,085 whole genome sequenced pneumococci collected between 2007-2010.

Myanmar

Thailand

Maela refugee camp: Approx 40,000 Karen refugees, Approx 2.4 km²

**Let's use this 3K collection to identify
genetic culprit for penicillin non-susceptibility**

Pennicillin susceptible

It worked!

But are these resistance alleles restricted to one lineage, or they pass on to others ?

- BC4 - 6B
- BC5 - 23A/23F
- BC6 - 15B/15C
- BC7 - 14

**Highest rate of recombination is observed in
Non-encapsulated pneumococci**
(Mann-Whitney test, p-val $1.76 \times 10^{-5}^*$)

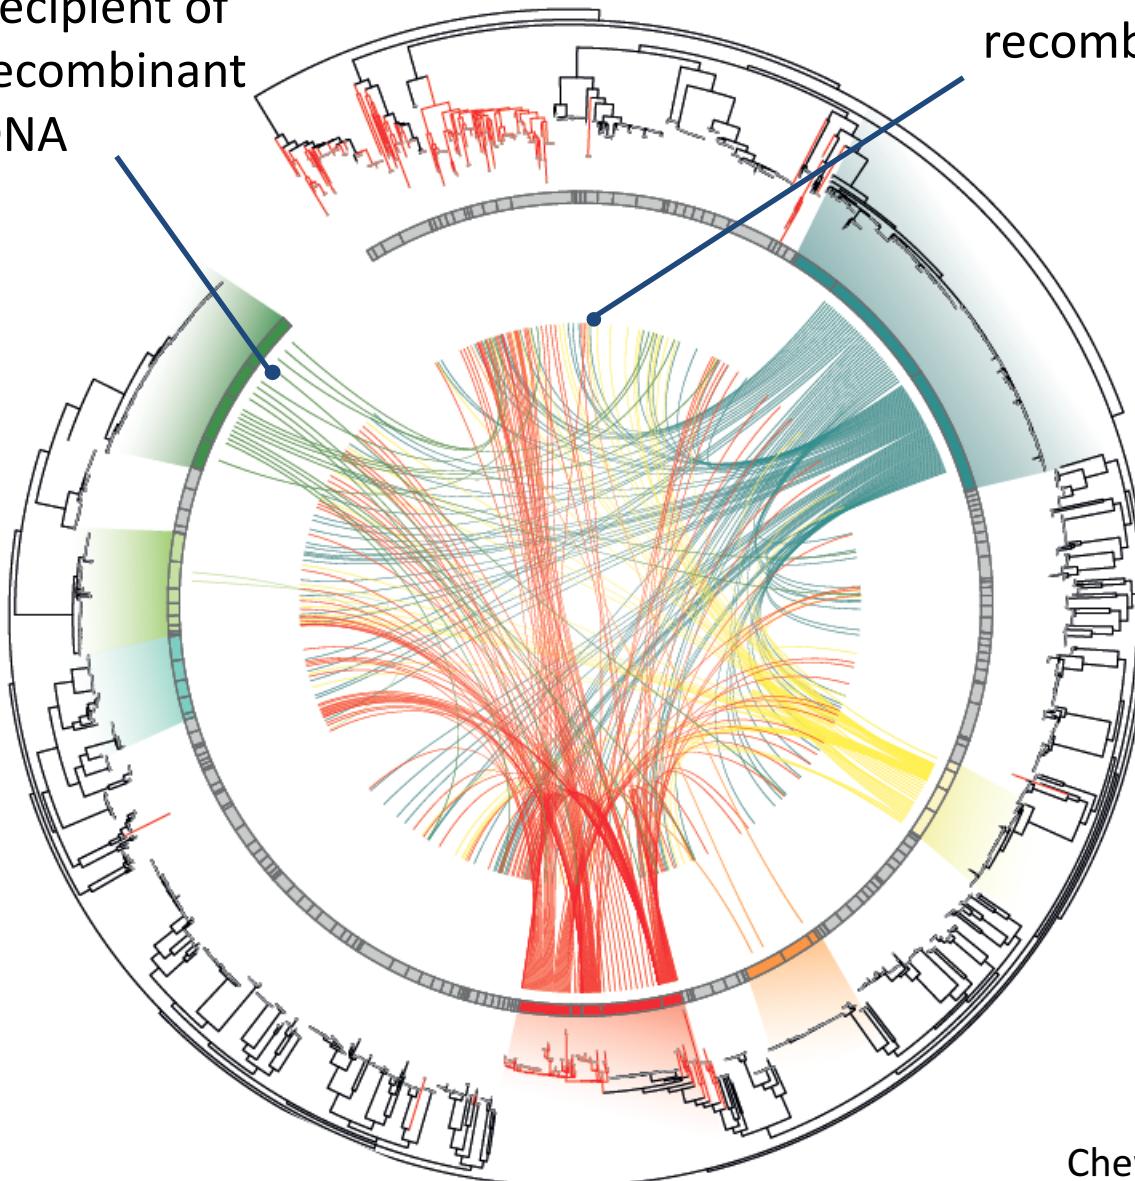

Highest rate of recombination is observed in Non-encapsulated pneumococci

(Mann-Whitney test, p-val 1.76×10^{-5} *, 2.44×10^{-3} **)

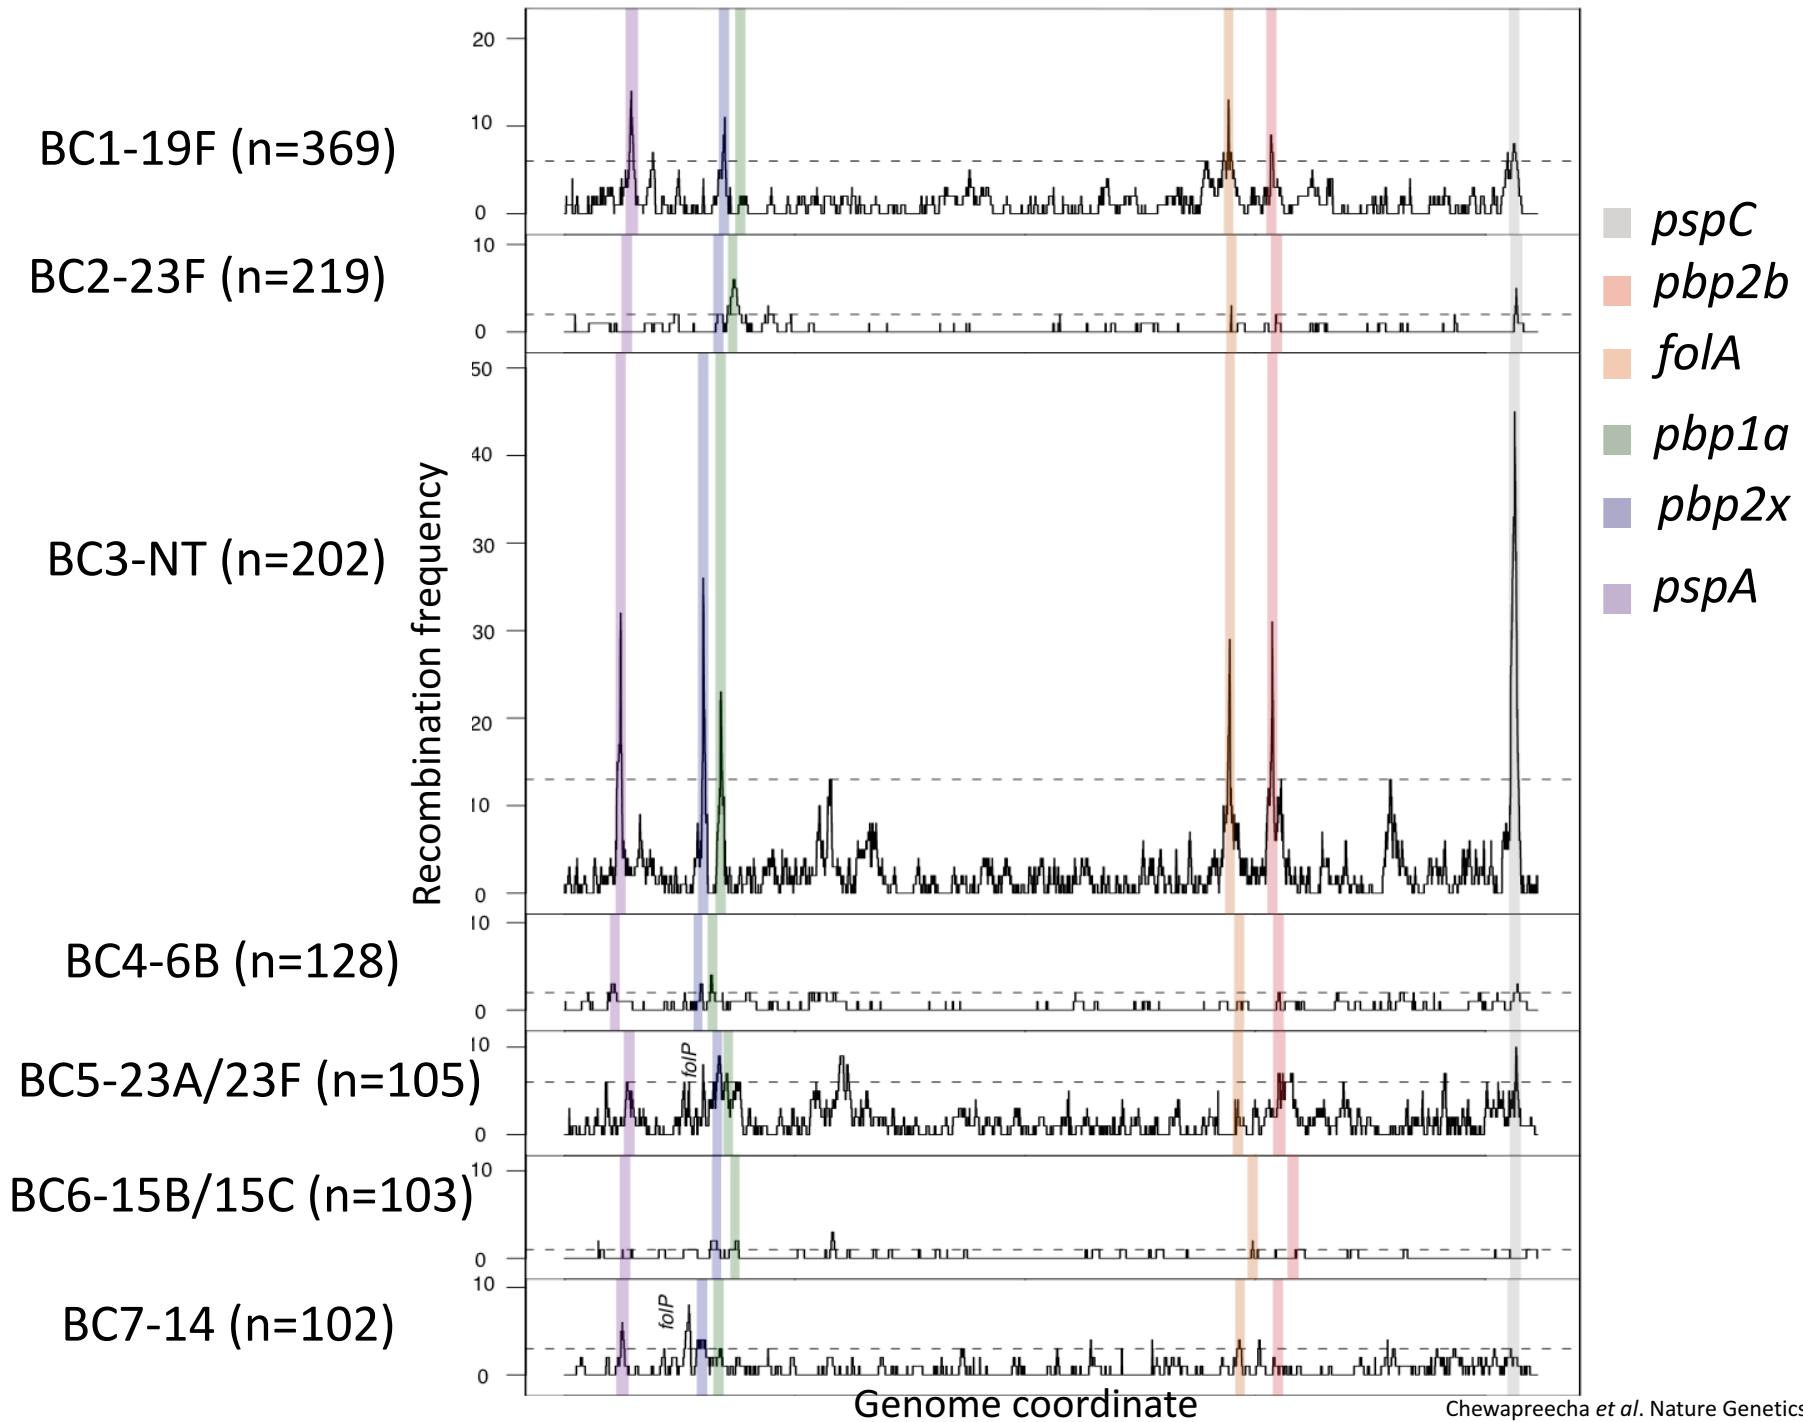

Recipient of recombinant DNA

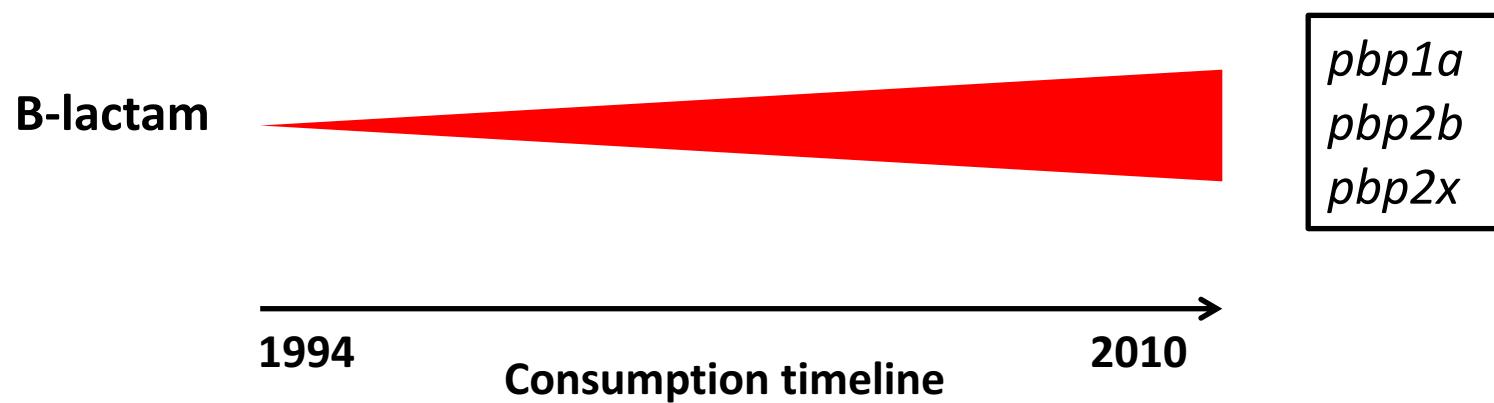

Potential donors of recombinant DNA

- Positive correlation between the probability of becoming donors and **cluster population size** (Spearman's rank correlation, $p\text{-val} = 2.69 \times 10^{-4}$)

-Positive correlation between the probability of becoming donors and **diversity observed within the clusters** (Spearman's rank correlation, $p\text{-val} = 1.45 \times 10^{-6}$)

Clinical Records

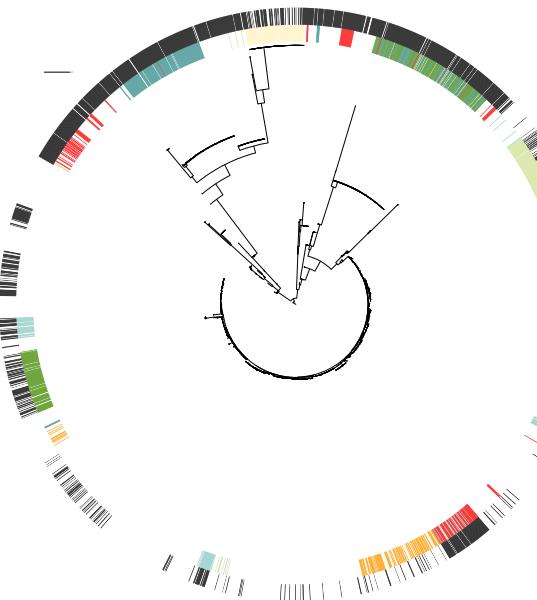

β -lactam resistant

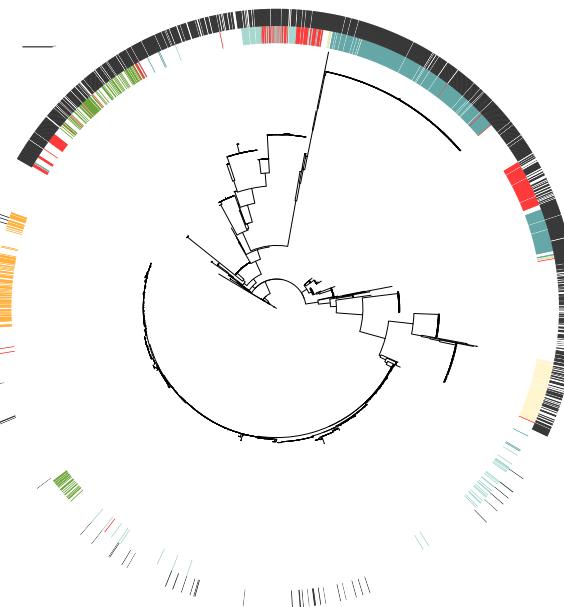

BAPS cluster: NT 15B/C 14 6B 23A/F 23F 19F The rest

Resistant profiles: Resistant Sensitive

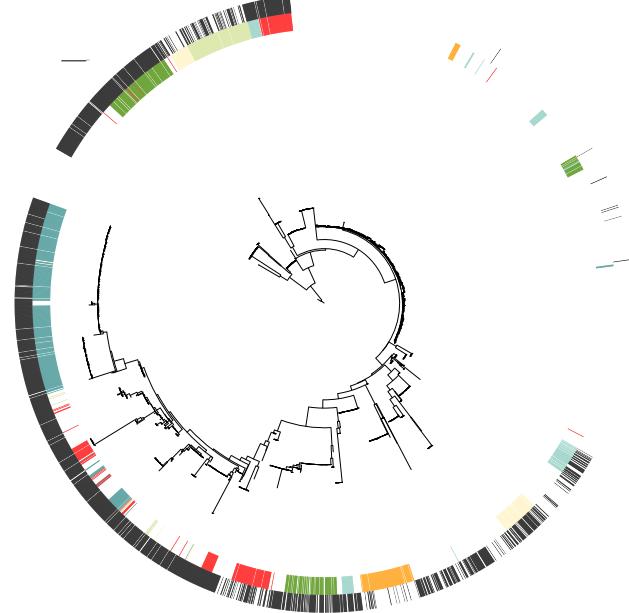

pbp1a

pbp2b

pbp2X

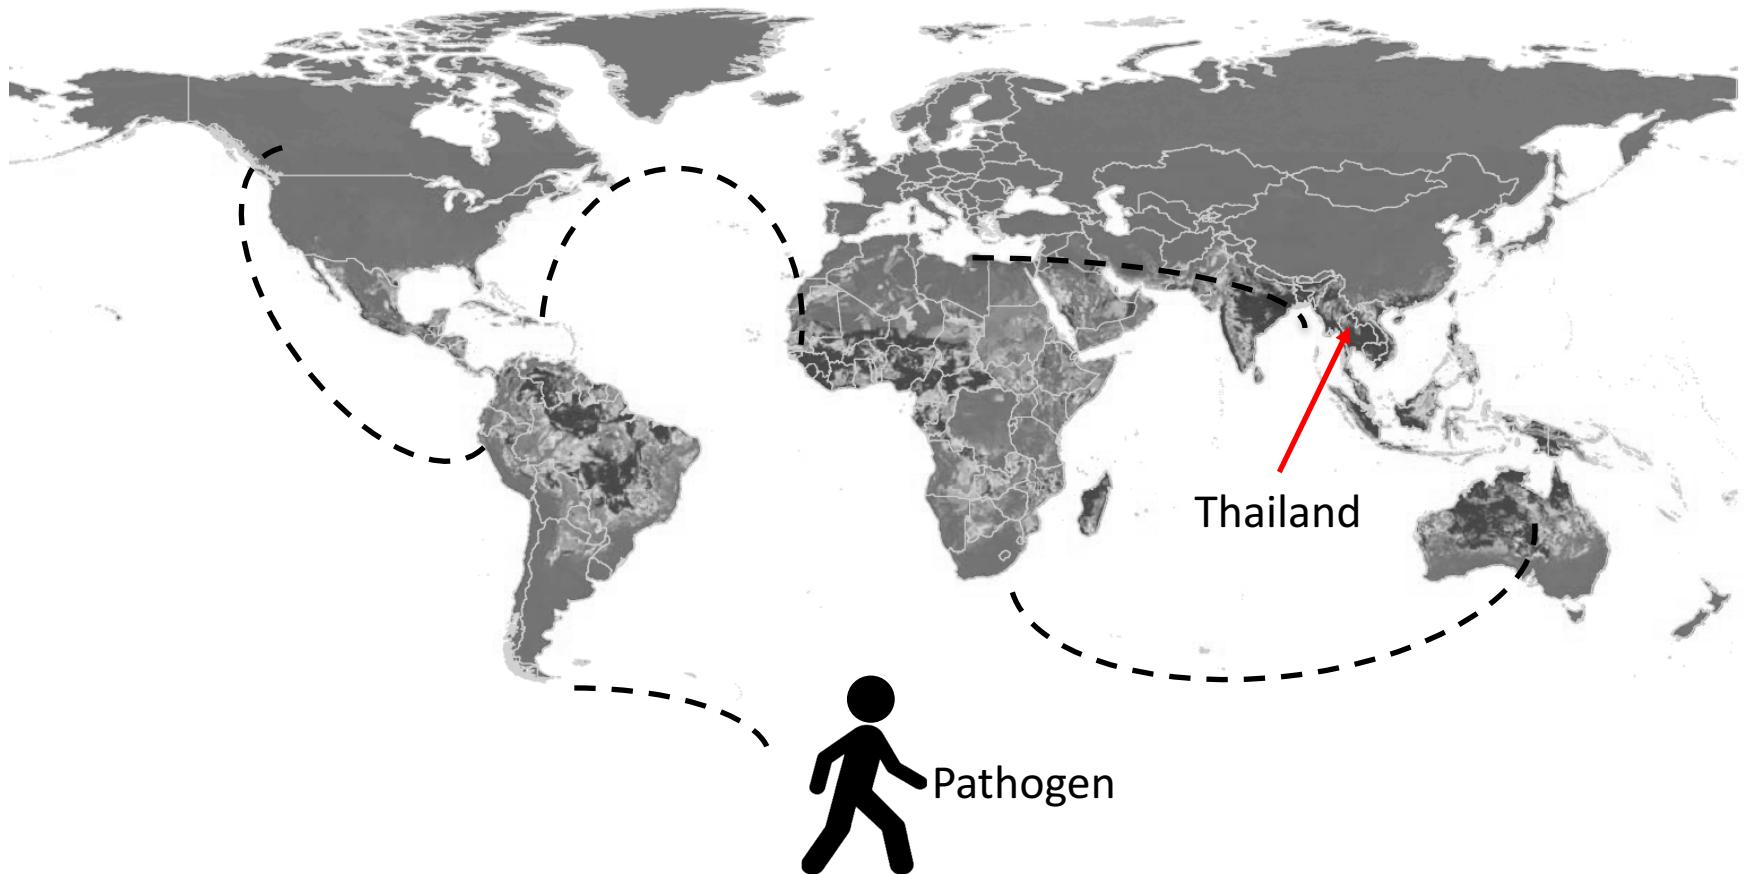

- Isolates undergone recombination at either *pbp1a*, *pbp2b* and *pbp2x* are phenotypically more resistant to B-lactam compared to those not having undergone recombination (Fisher's exact test: p-val < 2.2e-16)

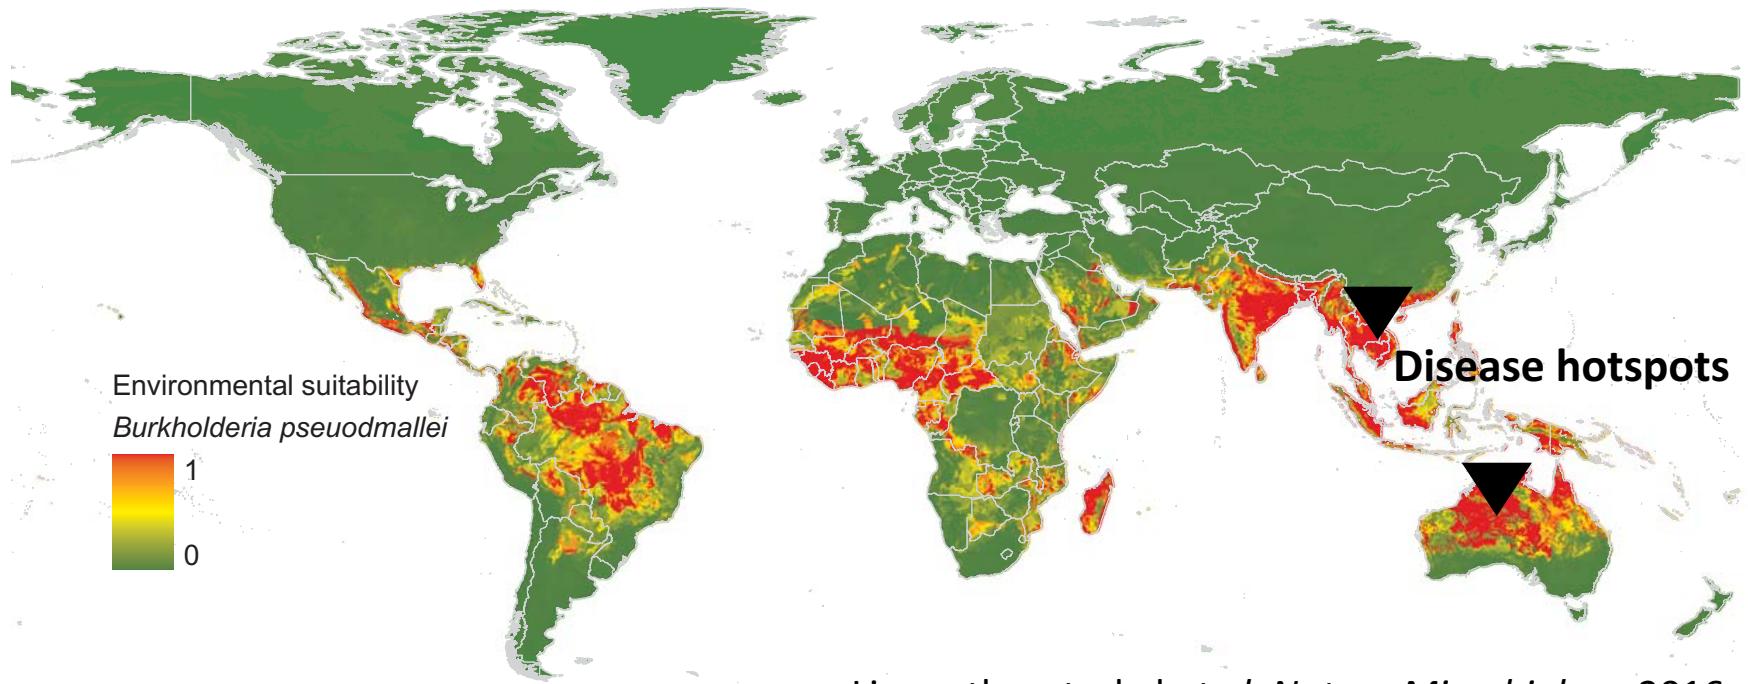

How whole genome sequencing can help tackle **antibiotic resistance** and dissemination of the deadly bacteria?

- By providing high resolution for identification of novel resistance alleles.
- By providing high resolution to dissect the mechanism that mediate the resistance alleles; and key players in the bacterial population.

**How whole genome sequencing can help tackle
antibiotic resistance and dissemination of
the deadly bacteria?**

Burkholderia pseudomallei: A global burden

Limmathurotsakul *et al.* *Nature Microbiology* 2016

- An estimated 165,000 cases of human melioidosis per year world wide
- 89,000 were predicted to be fatal.
- B. pseudomallei* is soil bacterium and thus should be geographically restricted. How did it travel globally?

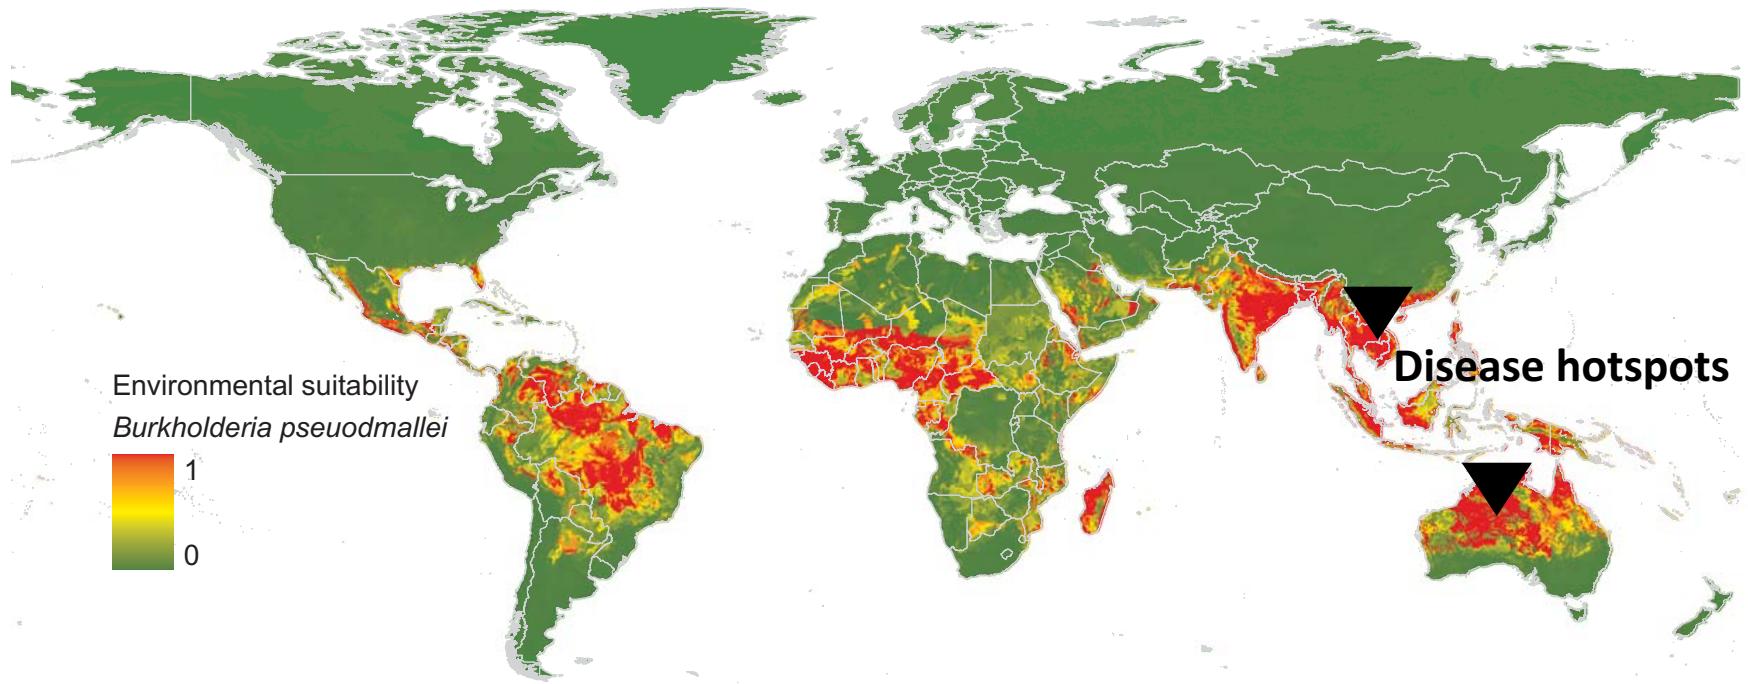

KEEP CALM AND TRACK TRANSMISSION

Prof Sharon
Peacock

A global burden

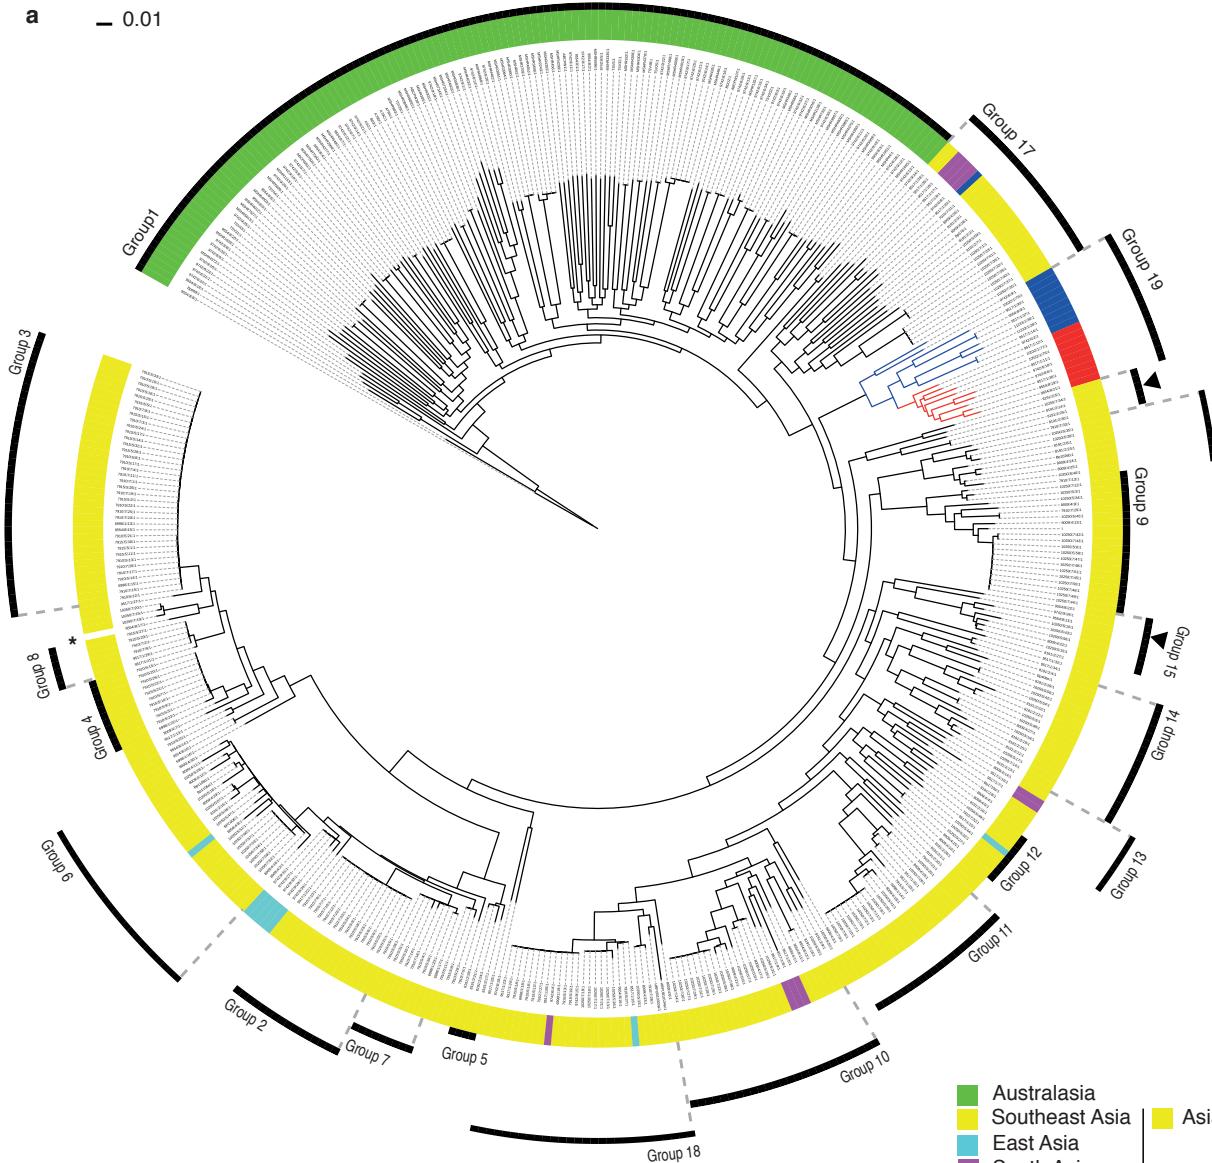

Limmathurotsakul *et al. Nature Microbiology* 2016

How did *B. pseudomallei* travel globally?

Data:

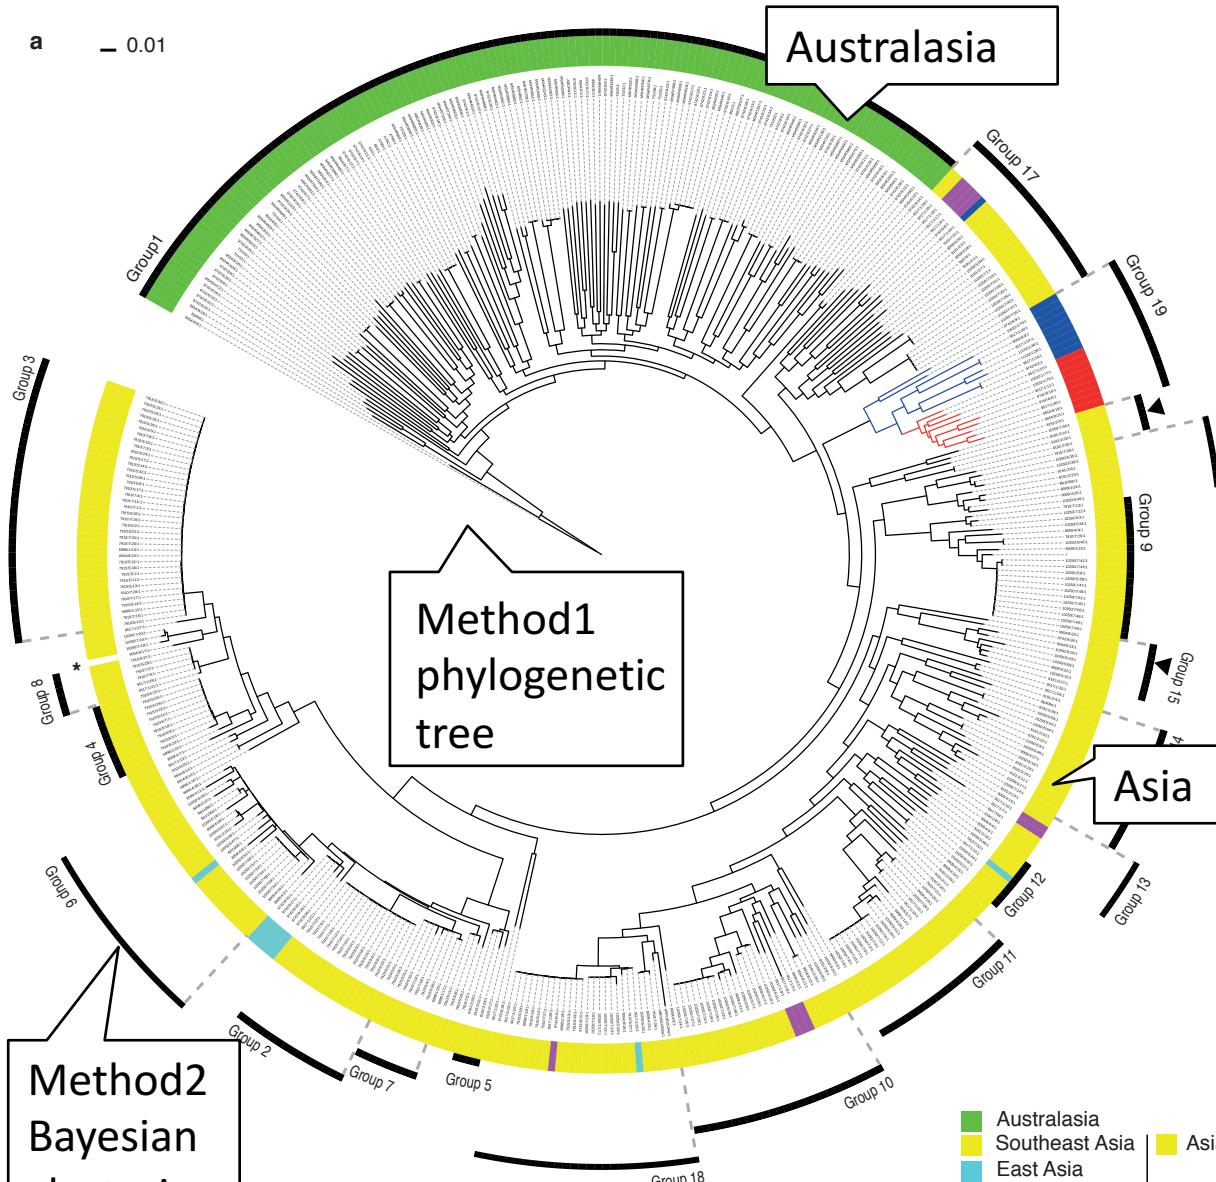

- whole-genome sequences of 469 isolates
- collected from 30 countries between 1935-2013

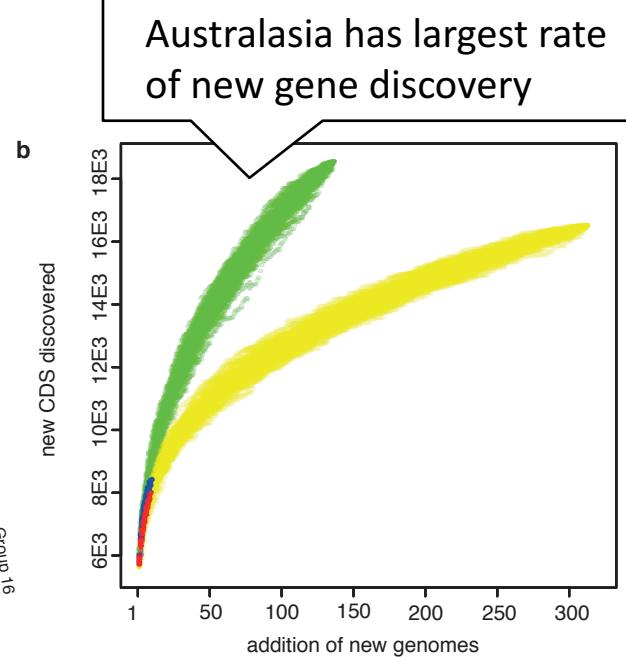

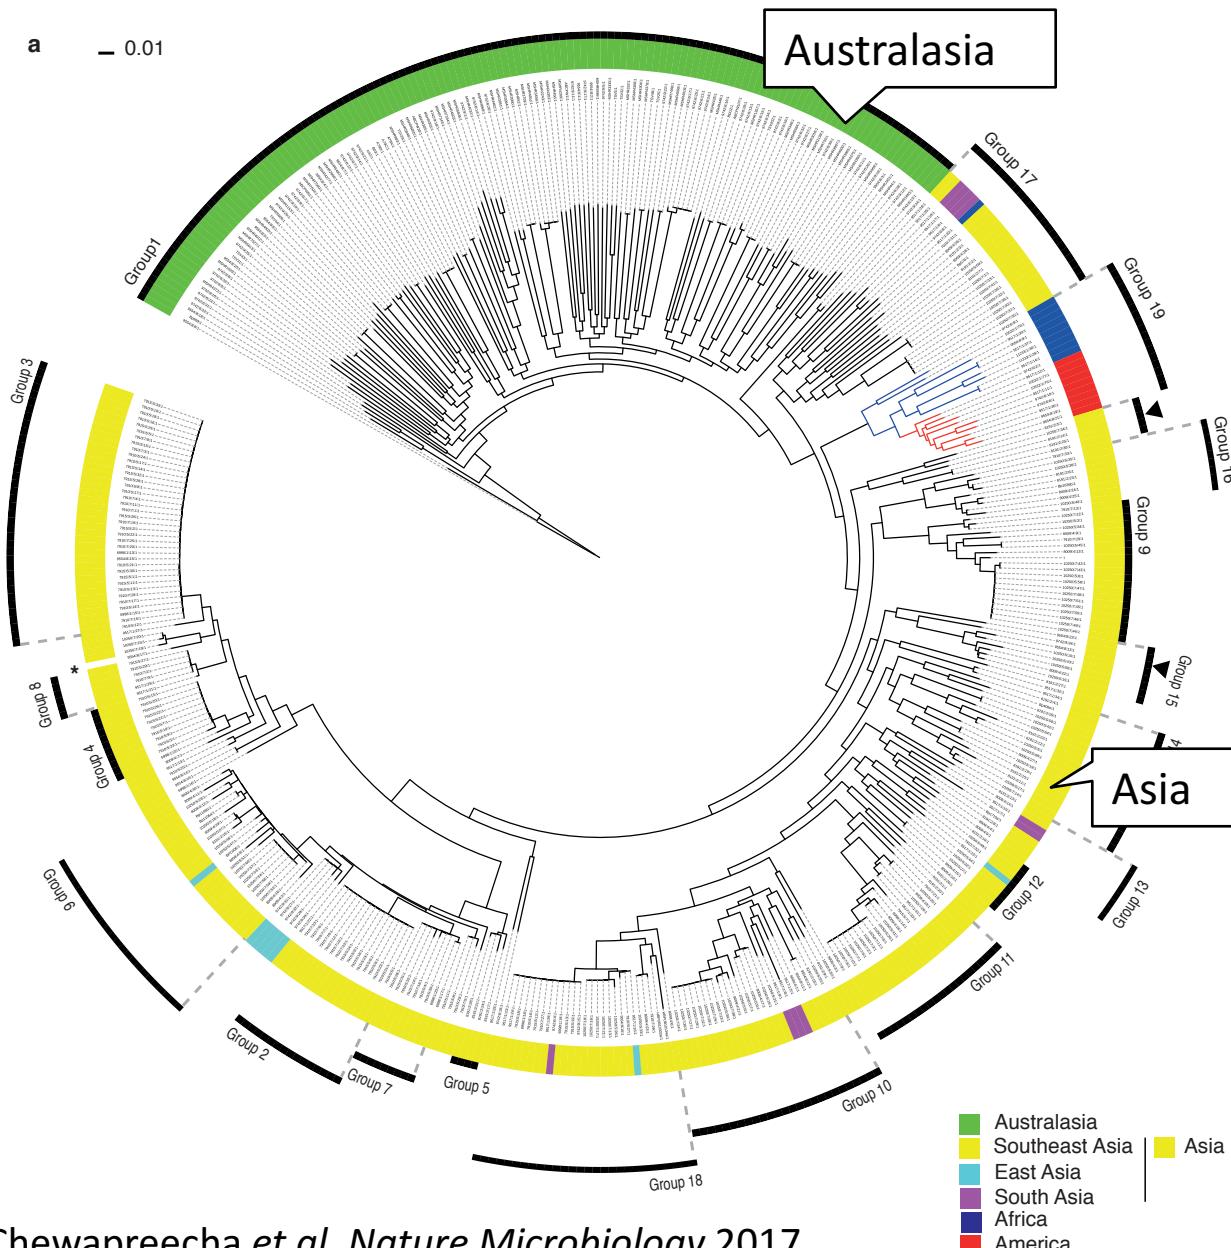

a - 0.01

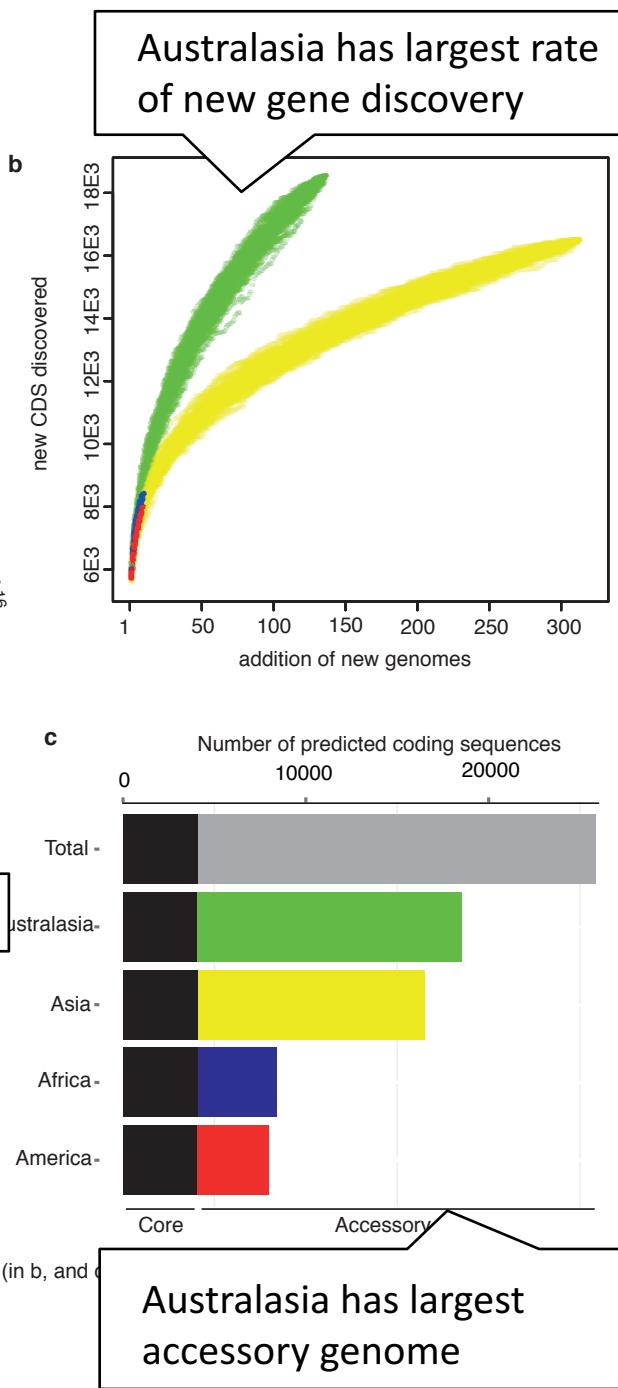

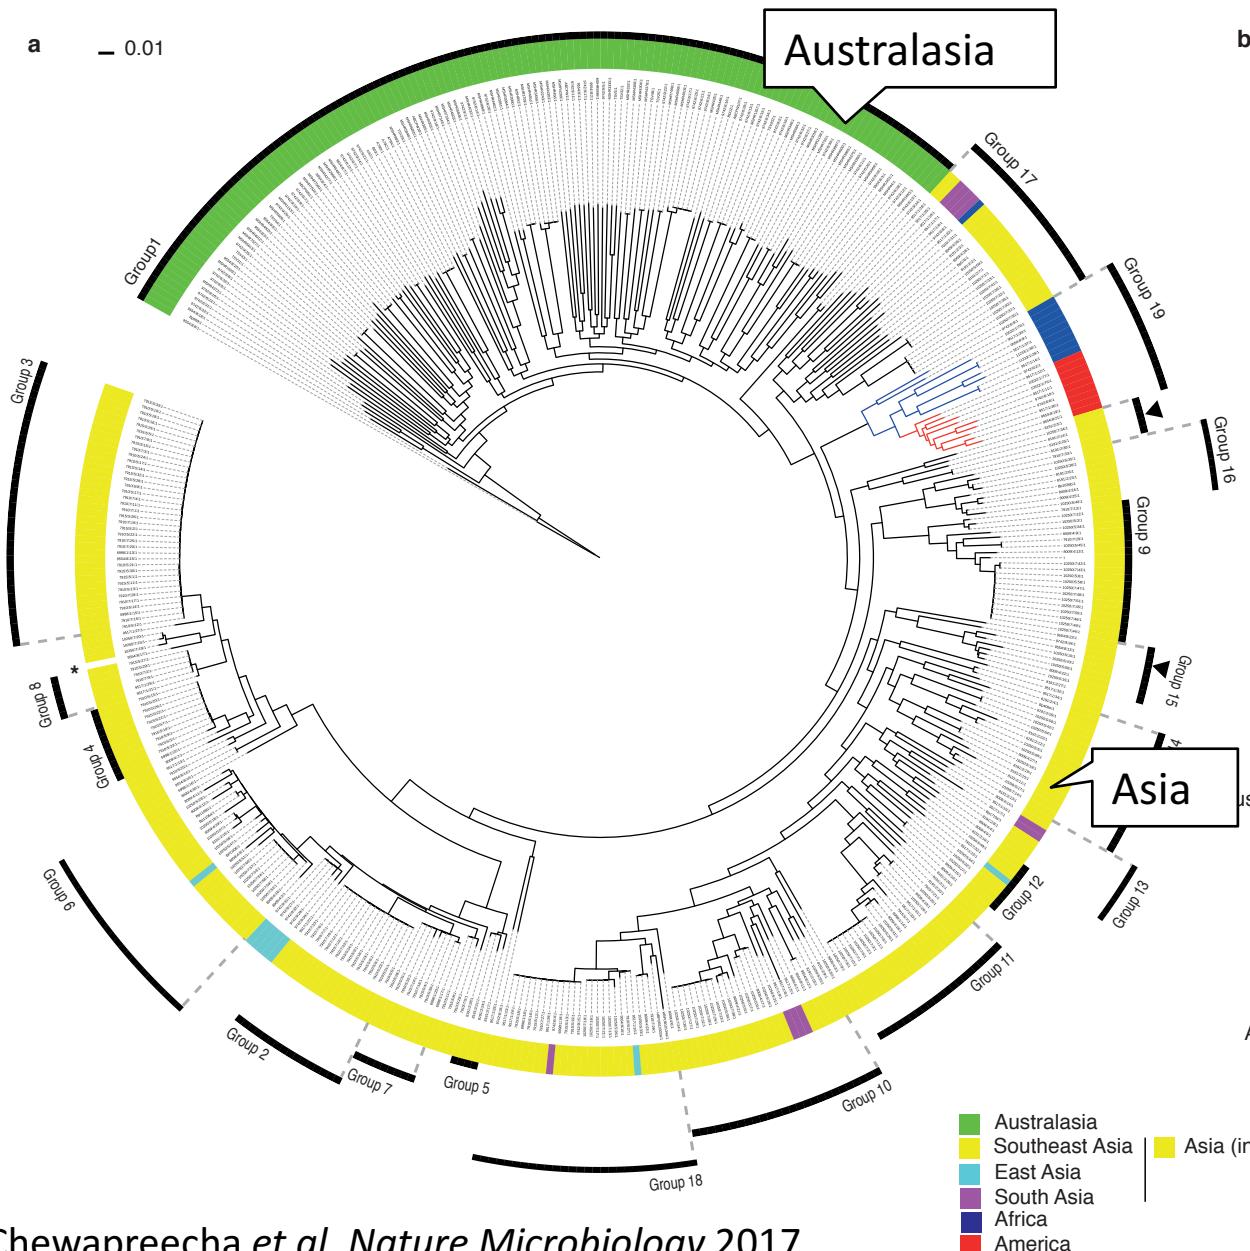

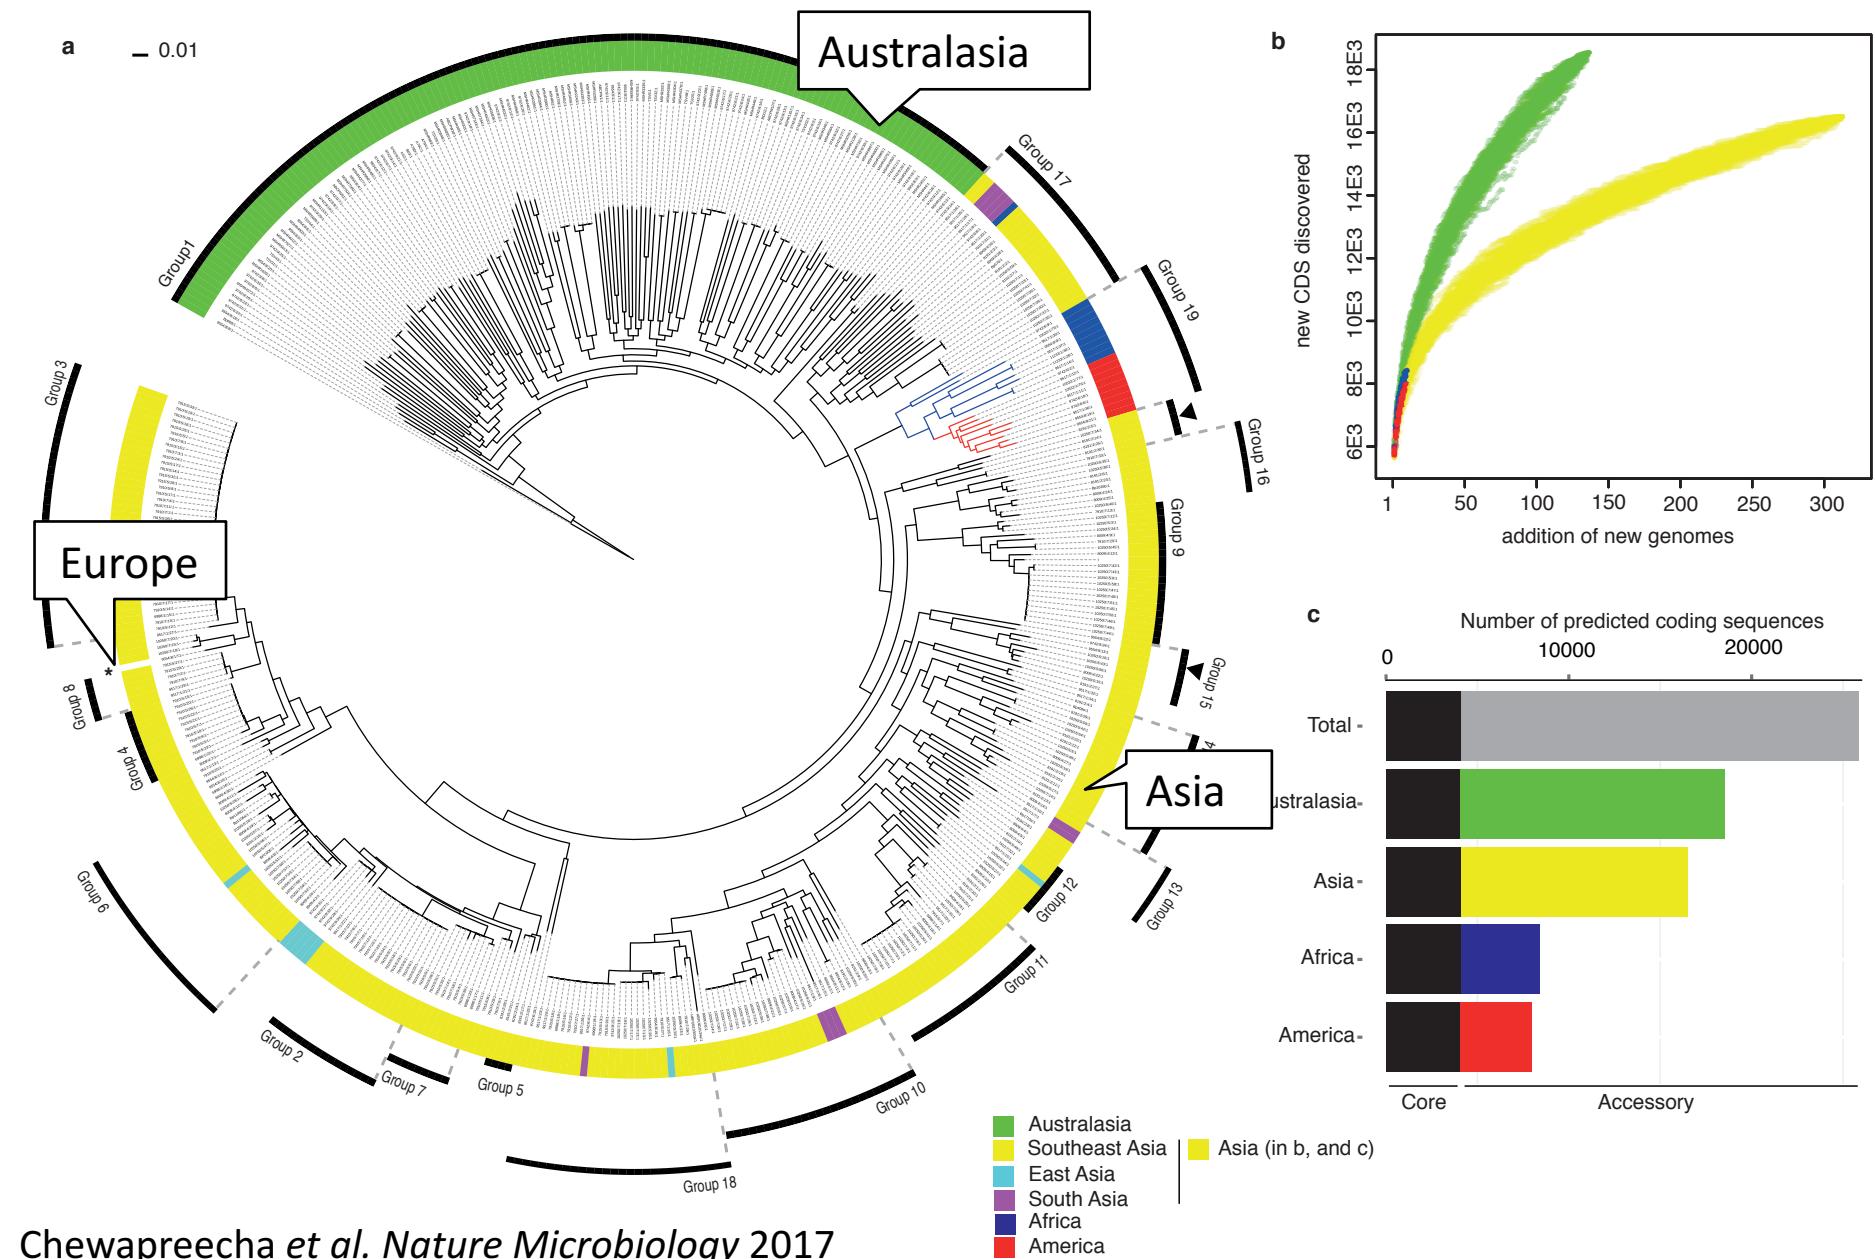

Australasia
Southeast Asia | Asia (in b, and c)
East Asia
South Asia
Africa
America

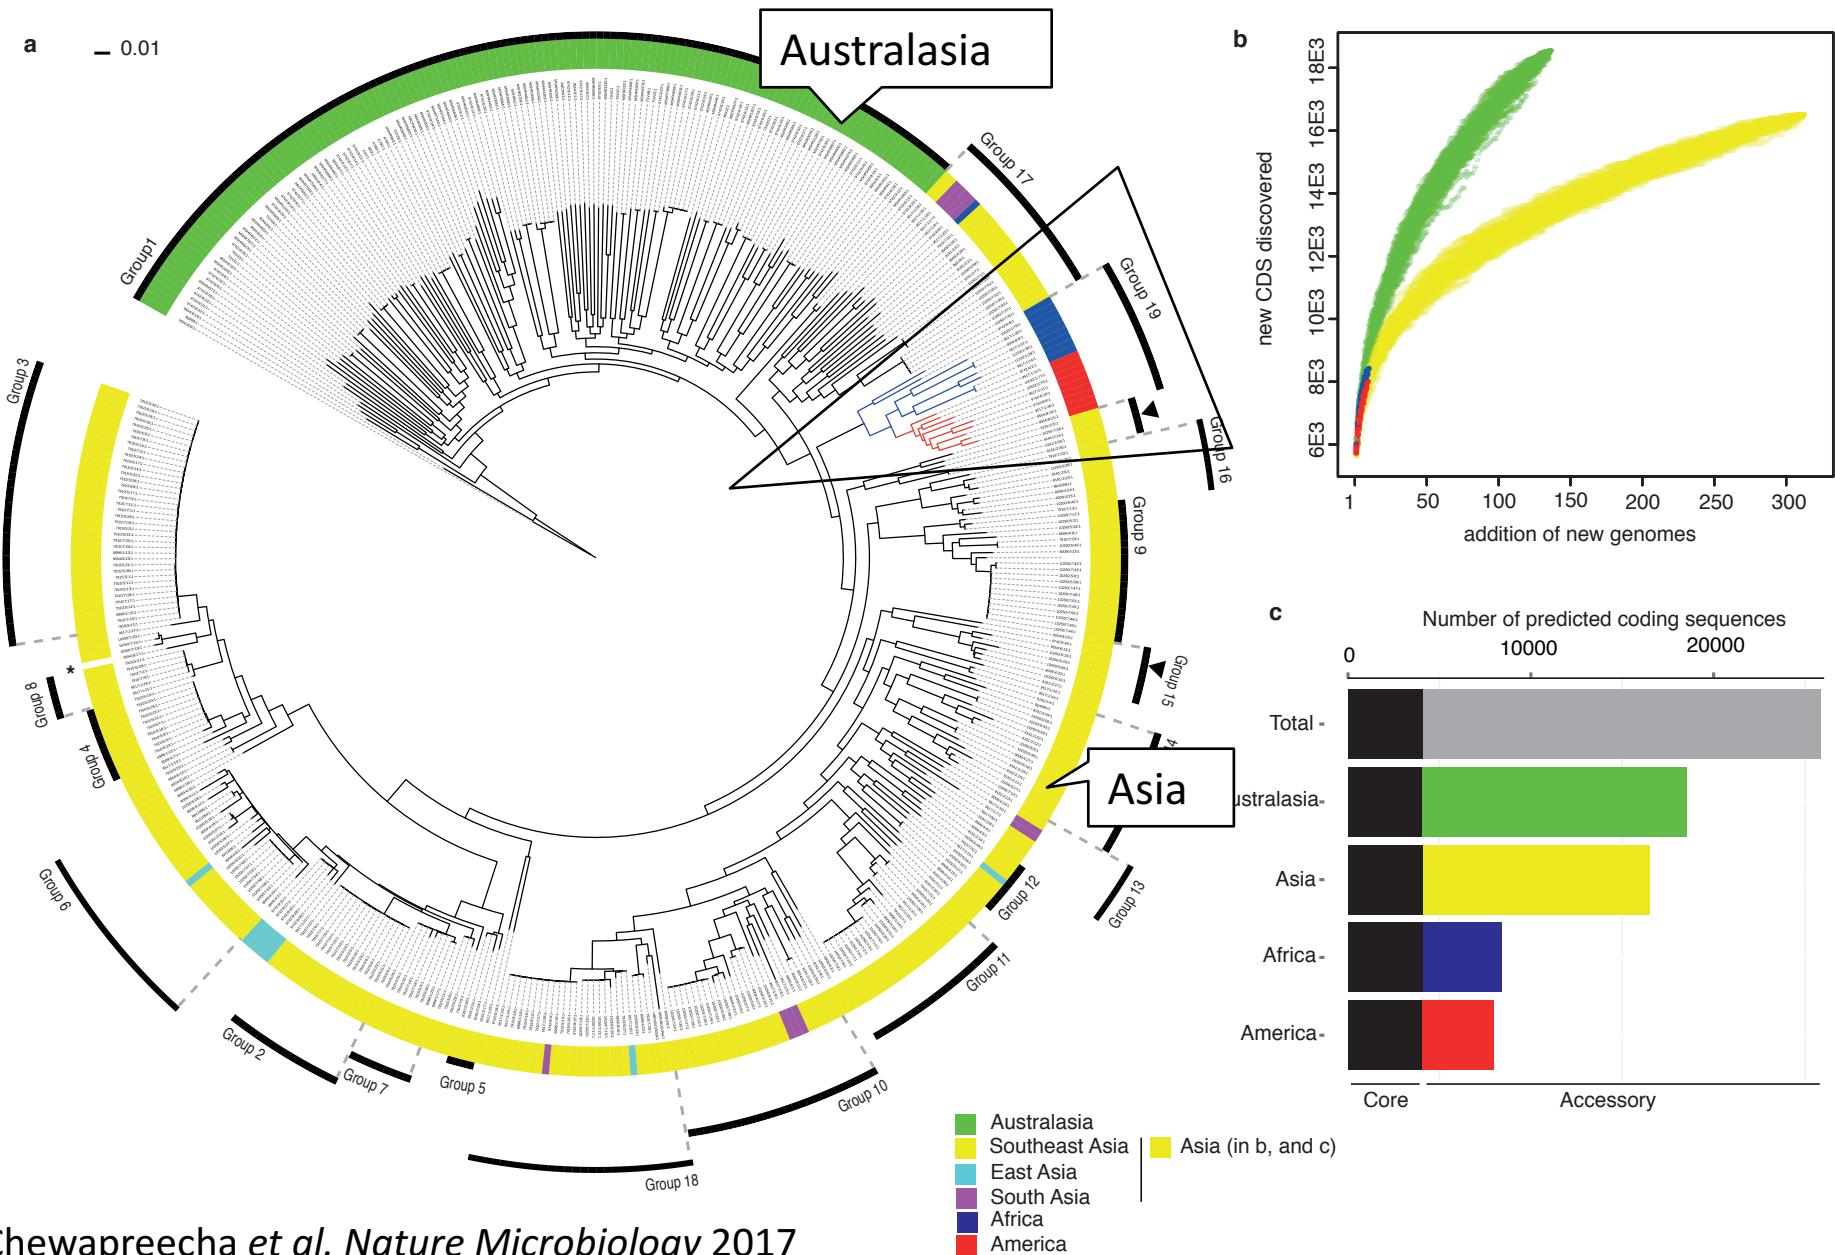

a - 0.01

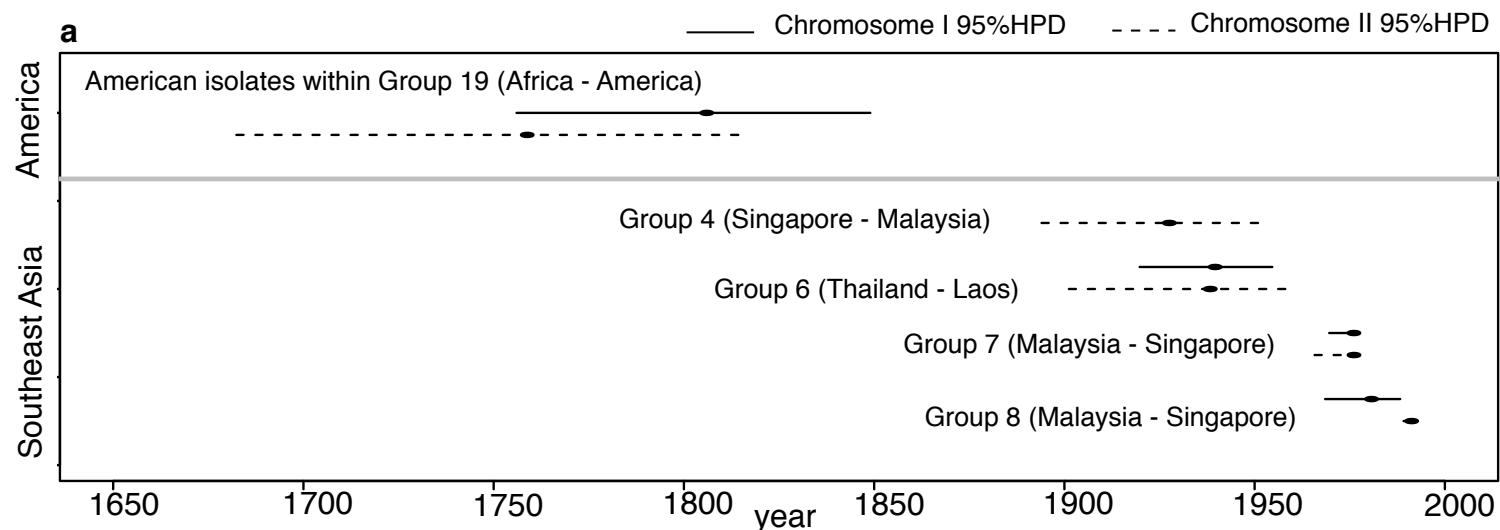

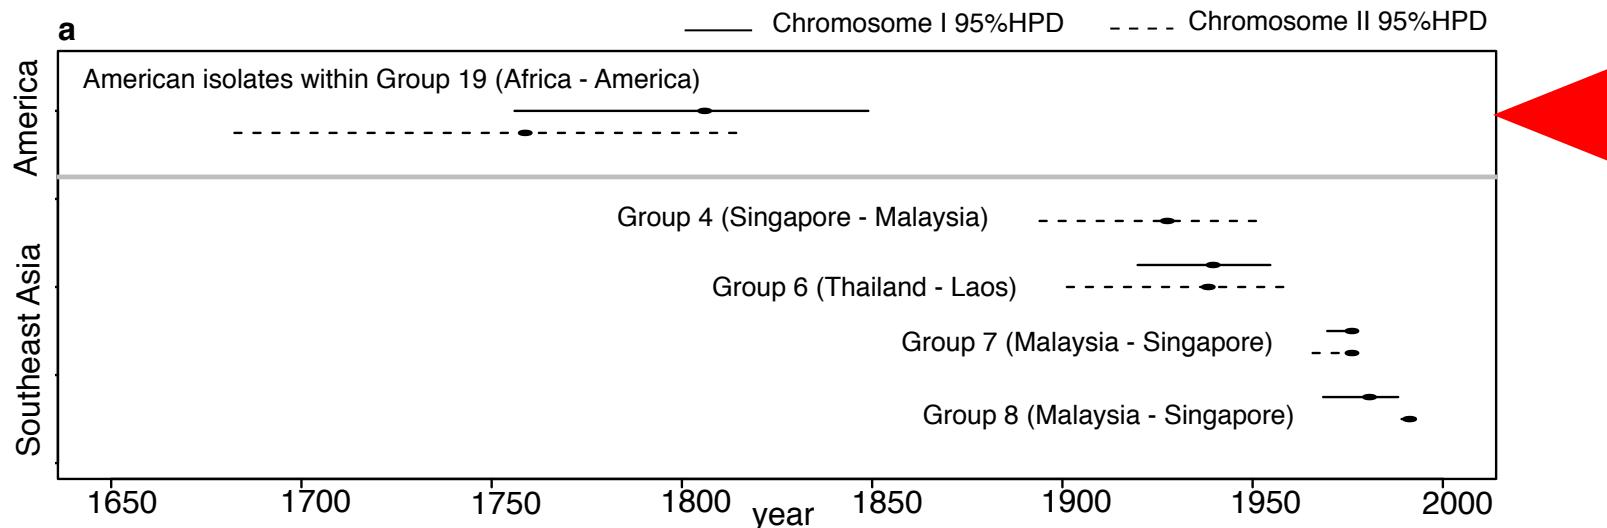

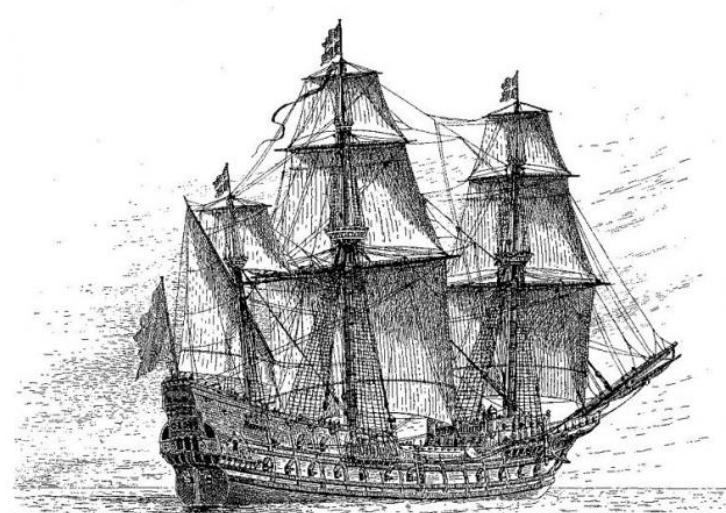

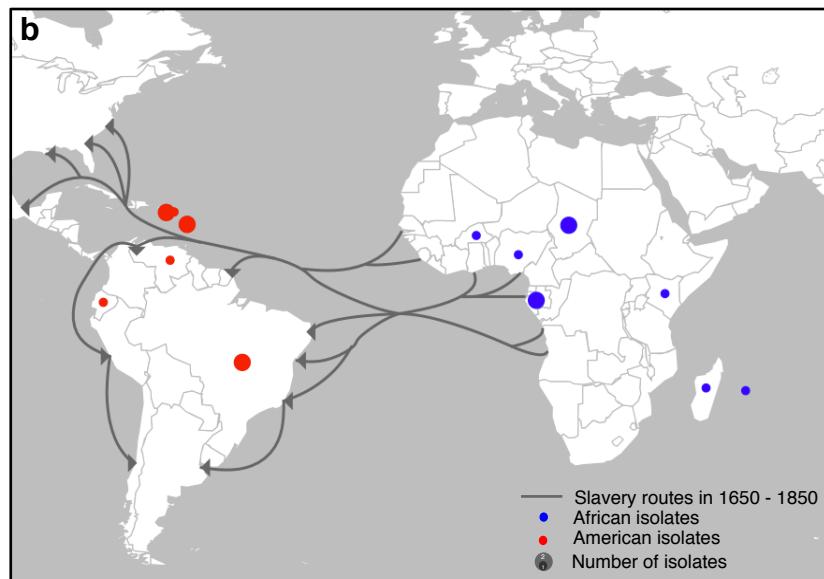

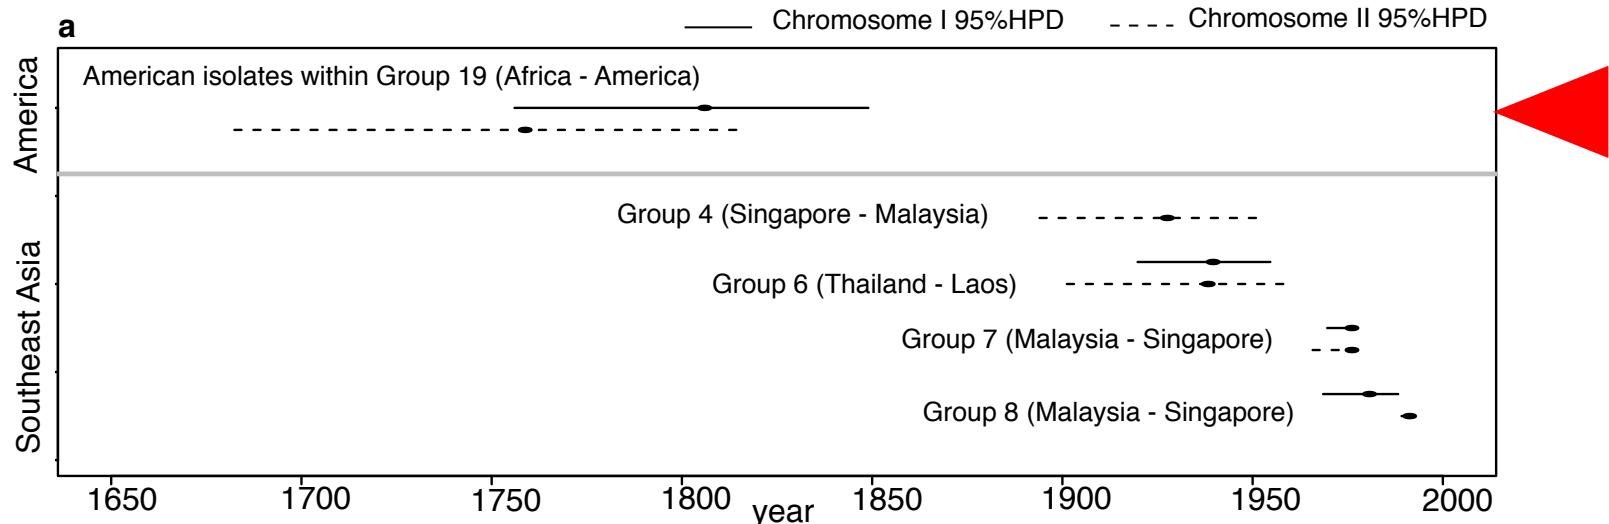

Historical timeline

Historical timeline

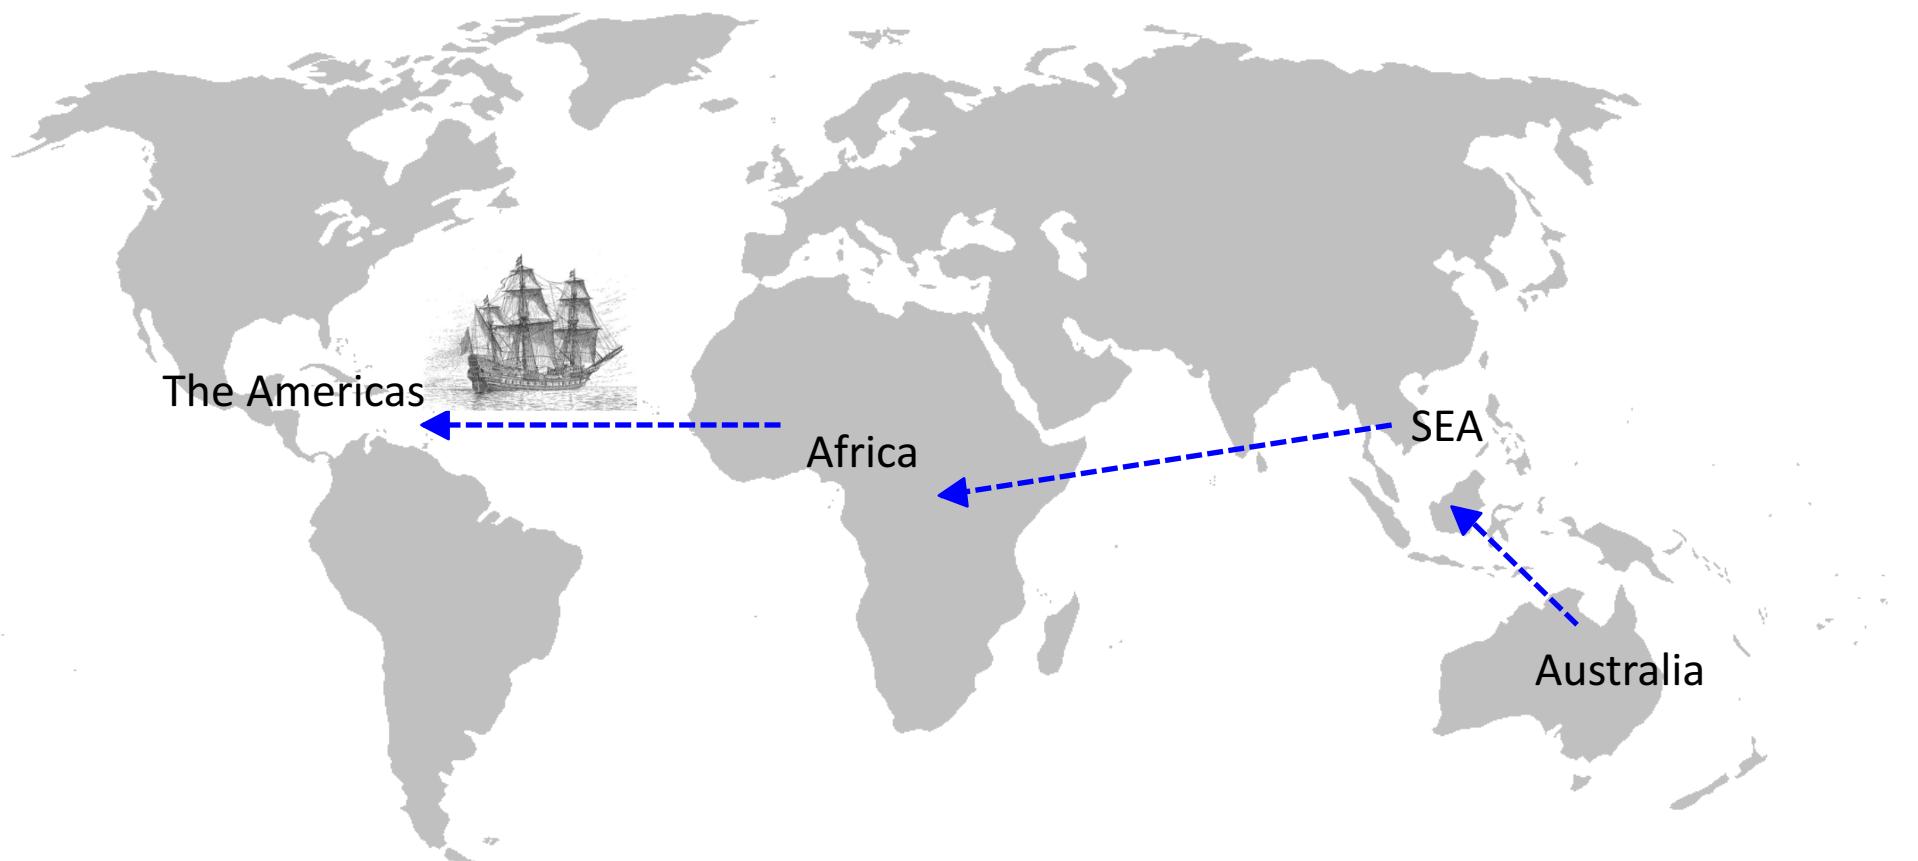

Historical timeline

Slave trade (1650-1850) was estimated to bring 10-15 millions from Africa to the Americas

How whole genome sequencing can help tackle antibiotic resistance and **dissemination** of the deadly bacteria?

How whole genome sequencing can help tackle antibiotic resistance and dissemination of the deadly bacteria?

- Identify genetic culprits for AMR
- Understand the mechanism of how bacteria develop AMR
- Track how bacteria (and AMR alleles) spread

THANK YOU SO MUCH!

I am around.

Me, a regular ~~intruder~~ visitor at 6.00 am

Sequencing Systems

Sequencing systems for every lab, application, and scale of study.

From the power of the **HiSeq X** to the speed of **MiSeq**, Illumina has the sequencer that's just right for you.

MiSeq

Focused power. Speed and simplicity for targeted and small genome sequencing.

NextSeq 500

Flexible power. Speed and simplicity for everyday genomics.

HiSeq 2500

Production power. Power and efficiency for large-scale genomics.

HiSeq X*

Population power. \$1,000 human genome and extreme throughput for population-scale sequencing.

Key applications

Small genome, amplicon, and targeted gene panel sequencing.

Everyday genome, exome, transcriptome sequencing, and more.

Production-scale genome, exome, transcriptome sequencing, and more.

Population-scale human whole-genome sequencing.

Run mode	N/A	Mid-Output	High-Output	Rapid Run	High-Output	N/A
Flow cells processed per run	1	1	1	1 or 2	1 or 2	1 or 2
Output range	0.3-15 Gb	20-39 Gb	30-120 Gb	10-300 Gb	50-1000 Gb	1.6-1.8 Tb
Run time	5-55 hours	15-26 hours	12-30 hours	7-60 hours	< 1 day - 6 days	< 3 days
Reads per flow cell†	25 Million‡	130 Million	400 Million	300 Million	2 Billion	3 Billion
Maximum read length	2 × 300 bp	2 × 150 bp	2 × 150 bp	2 × 250 bp	2 × 125 bp	2 × 150 bp

<http://systems.illumina.com/systems/sequencing.html>

The missing genetic “dark matter”?

More loci of smaller effect, might emerge with ever larger sample sizes?
Apparent heritability from epigenetic effects, rather than mutations?
Rare alleles, not represented in SNP screens, maybe with large effects?

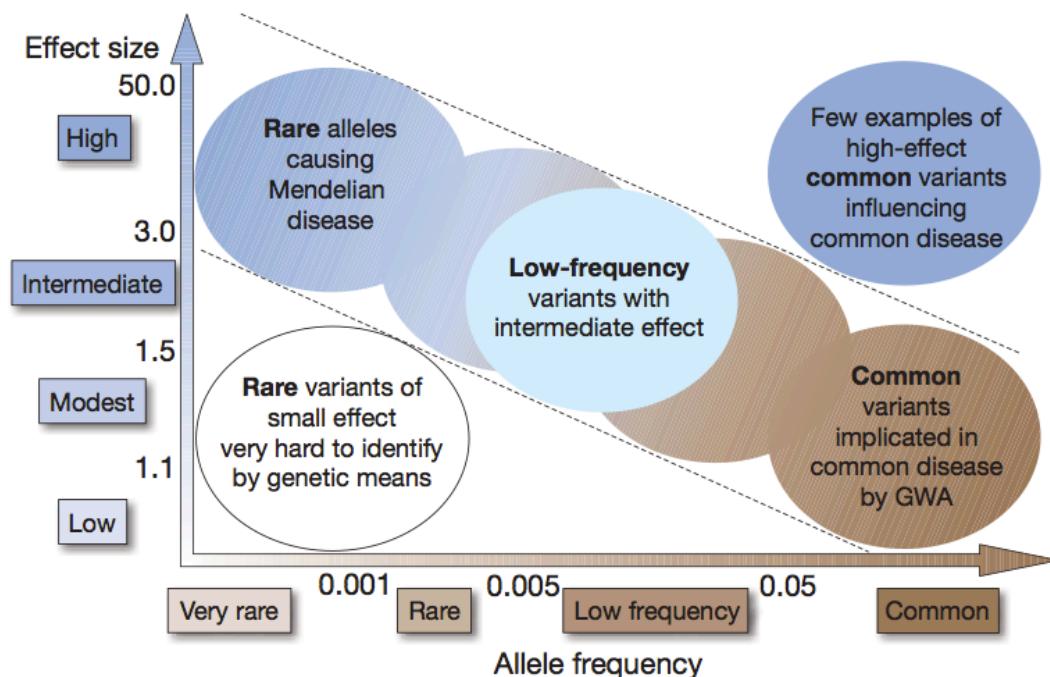

Figure 1 | Feasibility of identifying genetic variants by risk allele frequency and strength of genetic effect (odds ratio). Most emphasis and interest lies in identifying associations with characteristics shown within diagonal dotted lines. Adapted from ref. 42.

Manolio et al (2009) Nature
461:707-13

Detecting (usually rare) mutations of large effect:
Exome Sequencing, ~ 2% of genome
Faster & cheaper coverage of protein-coding sequence,
