

AFRIMS DENGUE DIAGNOSTICS

Rick Jarman., PhD, CPT, US Army

JITMM

29 June 2007

Diagnostic Goals

- **Detection of infecting virus or its components**

OR

- **Measurement of antiviral antibody**

Acute dengue virus infection

Dengue Diagnosis

Virus isolation

Mosquito inoculation (intrathoracic)

Toxorhynchites splendens

Mosquito cell culture

C6/36 (*Aedes albopictus*)

Molecular techniques

Reverse Transcriptase PCR
(RT-PCR, Nested PCR)

Real time PCR

NS1 antigen detection

Hemagglutination Inhibition (HI)

IgM and IgG ELISA

Anti-dengue Ig

Manifestations:

Shock
Hemorrhage
Encephalitis
Liver injury

Fever

Viremia

0

2

4

6

8

10

12

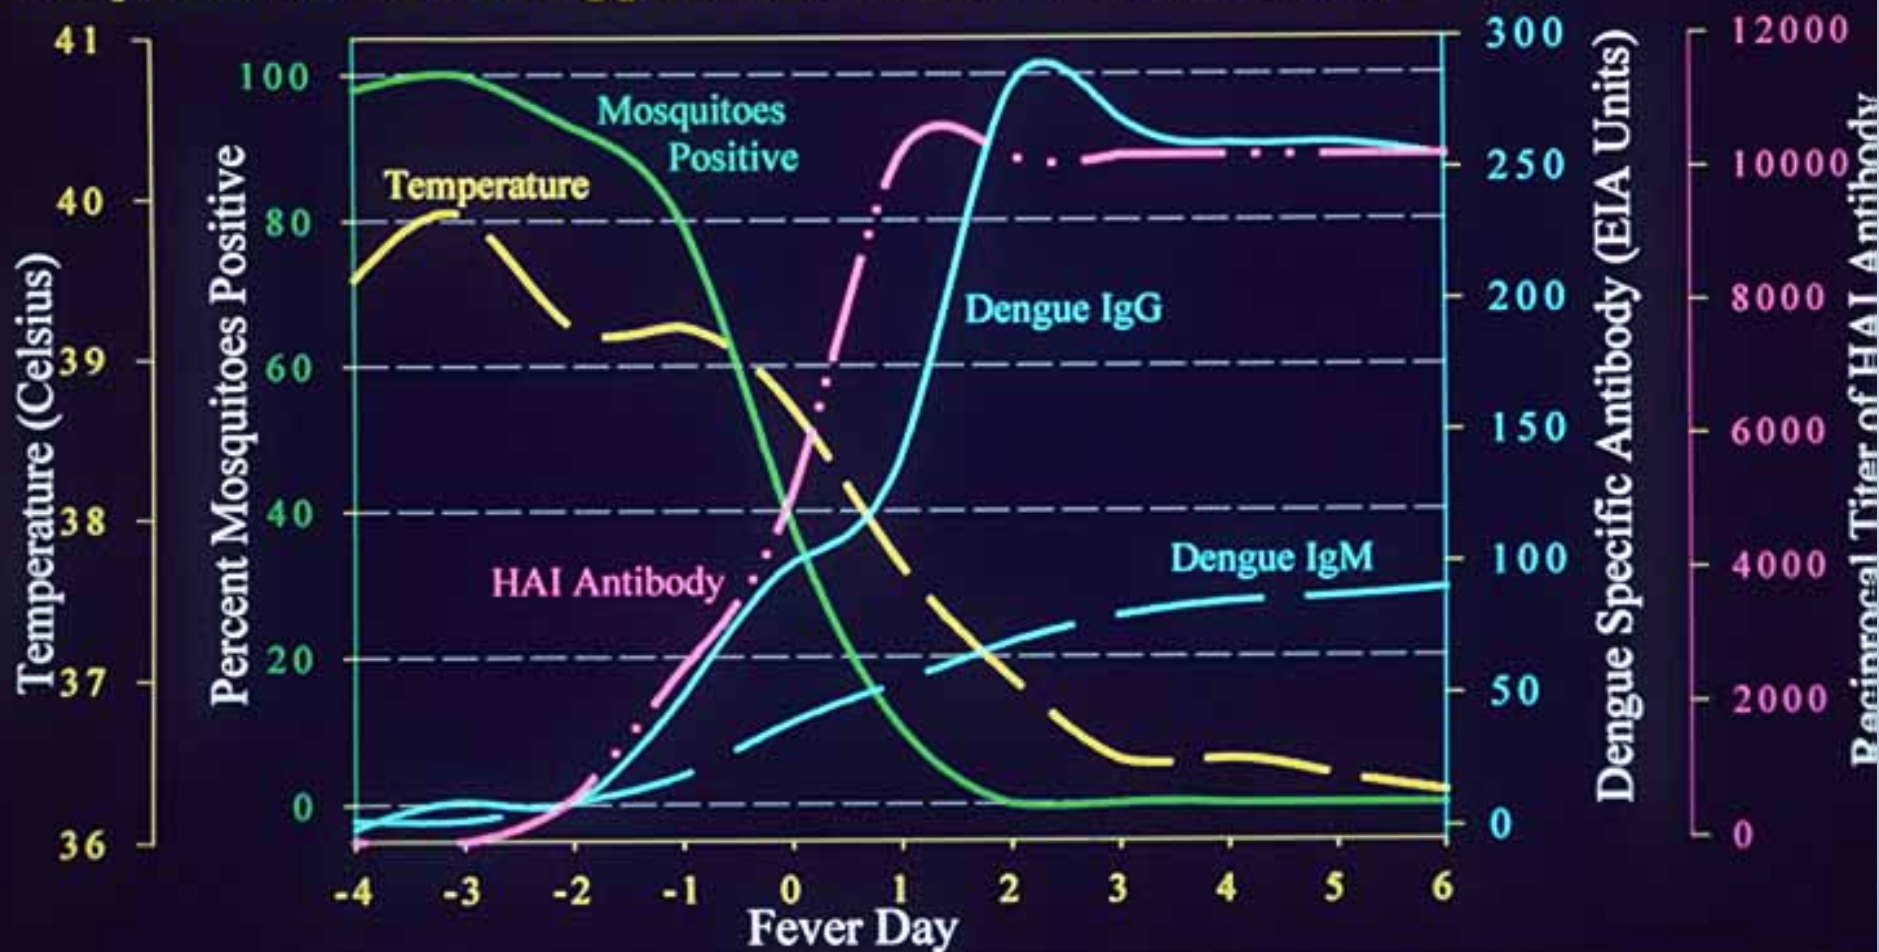

14

16

Days After Infection

Viremia and antibody based diagnostic tests: mean values by fever day in patients with secondary dengue infections by maximum daily temperature, % mosquitoes positive for virus, dengue IgM and IgG antibody levels, and reciprocal titer of hemagglutination-inhibition antibody (HAI)

Vaughn DW et al. J. Infect Disease 1997 (2) : 322-30

Diagnostics at AFRIMS

- Serology
 - IgM/IgG ELISA
 - HAI
 - Plaque Reduction Neutralization
- Antigen
 - NS-1
- NA
 - Nested PCR
 - Real-time PCR (Quantitative)
 - Sequencing
- Viral Isolation
 - Direct C6/36 cells
 - Mosquito Inoculation

What to do?

- 1) Laboratory diagnosis of clinical cases
 - IgM/IgG -acute/convalescent (Serological diagnosis)
 - Nested PCR (serotype)

Discordant results

Repeat assay

Viral isolation

HAI

What to do?

2) Surveillance (Cohort-Study)

– Off-Season

- HAI (asymptomatic infections)
- PRNT (baseline)

– Acute infection

- EIA (Serological Diagnosis)
- Nested PCR
- Real-time PCR (Viral Load Study) (selected)
- PRNT of symptomatic and asymptomatic infections (selected)
- Viral Isolation (Selected)
- Sequencing (Selected)

What to do?

3. Outbreaks

- EIA (Often on single specimens)
- Nested PCR (used for serotyping and to aid in serological diagnosis)
- Sequencing

Assays- EIA

- Used for all dengue studies

1. Coat plate with goat anti-human IgM OR IgG

2. Add test specimens (serum or CSF),
Negative and Positive controls

3. Add dengue antigens (dengue 1- 4)

4. Add human anti-flavivirus IgG- HRP

5. Add substrate, incubate, stop reaction,
OD at 492

Specimen type	Results	interpretation
Paired	IgM:IgG >1.8 and IgM \geq 40	Acute Primary Infection
Paired	IgM:IgG <1.8 and IgM \geq 40	Acute Secondary Infection
Paired	IgM:IgG <1.8 and IgM \geq 40 <u>IF</u> IgM<40 IgG rise between S1 and S2 to >100 <u>IF</u> IgG <100 confirm with HI	Acute Secondary Infection

Specimen type	Results	Interpretation
Paired	IgM <40 AND IgG >100 <u>IF</u> S1 <40 and IgG >100 and S2 IgG drop to less than 100	Recent Secondary Infection
Paired	IgM<40 and IgG >100	Suggestive Secondary Infection
Single	IgM>40	Acute Dengue Infection
Single	IgM <40 And IgM:IgG <1.8 and PCR Positive	Secondary Infection

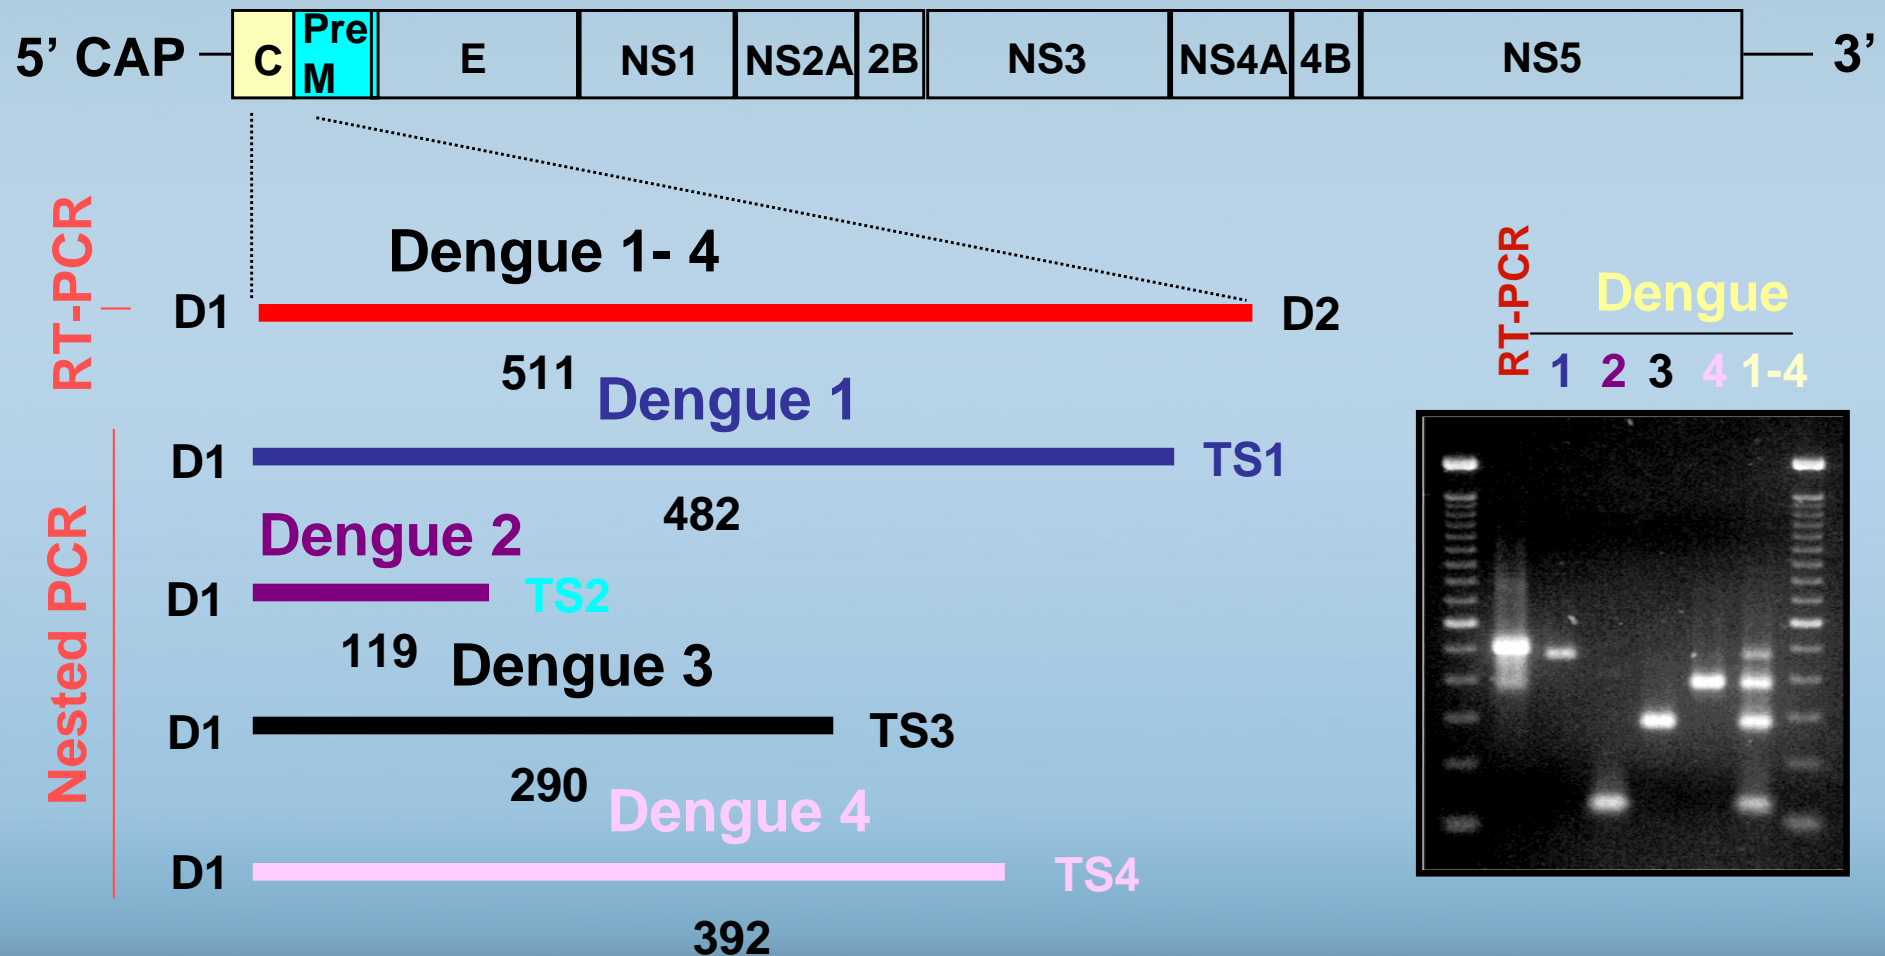

- Acute and convalescent sera interval should be ≥ 7 days to make serologic diagnosis as “No Evidence of Recent Flavivirus Infection”

Dengue Virus PCR

Lanciotti et al., (1992) J. Clin. Microbiol. 30: 545

RT-PCR → Nested PCR with type specific primers

Hemagglutination Inhibition Test

Virus

Antibody

No Hemagglutination
(Hemagglutination Inhibition)

Figure Four: Example of Six Patients with Hemagglutination Inhibition Titers to den-2.

Interpretation of the dengue hemagglutination-inhibition test

Antibody response	Specimen Interval	Conversion titer; any dengue Ag	Interpretation
$\geq 4x$ rise	≥ 7 days	$\leq 1:1280$	Acute flavivirus infection, primary
		$> 1:1280$	secondary
No change	Any	$> 1:1280$ specimen	Recent flavivirus infection, secondary

Isolation and Identification of Dengue Viruses

Specimens

- Serum
- CSF
- Tissue

Toxorhynchites splendens
(intrathoracic inoculation)

10-14 days

Head squash

Negative

Indirect Immunofluorescence Assay

Positive

Grind mosquito body

C6/36 cells

7 days

Cell culture fluid

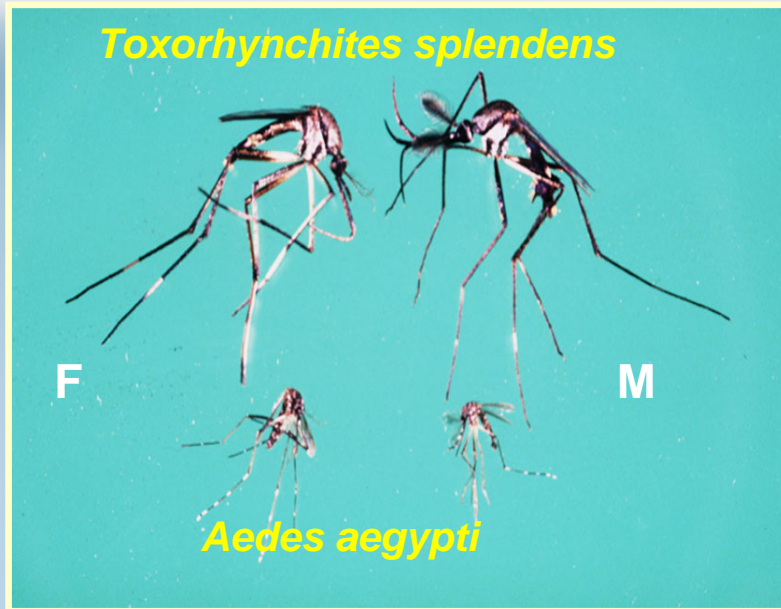

Storage
at -70° C

Typing by ELISA using
mouse monoclonal Ab

Toxorhynchites splendens (intrathoracic inoculation)

Indirect Immunofluorescence Assay

—

+

Dengue Virus Isolation in C6/36 Cells

Dengue Virus Identification by Typing ELISA with Dengue Specific Monoclonal Antibodies

Coat plate with goat anti-mouse IgG 

Add specific mouse monoclonal antibodies 

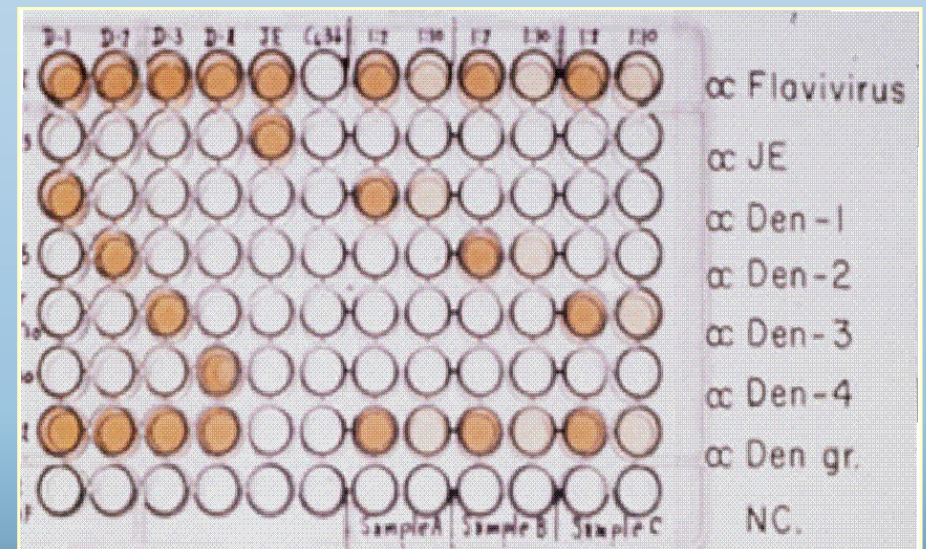

Add test sample, Dengue 1-4 antigen, and normal cell fluid (negative control) 

Add human anti-flavivirus HRP 

Add substrate, stop reaction, and read O.D. at 492 nm. 

Plaque Reduction Neutralization test

- Mixture of serum and reference virus or clinical isolate to determine if sample has antibodies that can stop virus from infecting cultured cells
 - Used to assess presence of neutralization antibodies
 - Can be used to determine seroconversion
 - Single specimen: provides prior dengue virus serotype exposure (limited by cross-reactivity between dengue serotypes and between flaviviruses soon after infection)
 - Paired specimens: 4-fold rise for any given serotype suggests an intervening dengue virus infection

Plaque Reduction Neutralization Test (PRNT)

3-5 4 fold dilutions of heat +
inactivated test sera

Reference viruses:50 PFU

Dengue 1(16007), Thailand
Dengue 2(16681), Thailand
Dengue 3(16562), Philippines
Dengue 4(1036), Indonesia
JE(SA-14-14-2), China

LLC-MK2 or Vero cells

4-7 days

Stain with neutral red, plaque count

50% plaque reduction by Probit analysis

DEN-1 viral plaques per well and serial dilution of test sera

1:640

1:2,560

**Virus
control**

1:10

1:40

1:160

Variation of PRNT

- Single Dilution Neutralization
 - 1:30 dilution
 - Used for screening
 - Used as dengue serotype sero-survey
- Microneutralization
 - Can be used as PRNT
 - Can be automated
 - Readout by spectrophotometer
 - High Throughput

Real time PCR

Low Risk of Contamination

Data Acquisition

Amenable to Validation

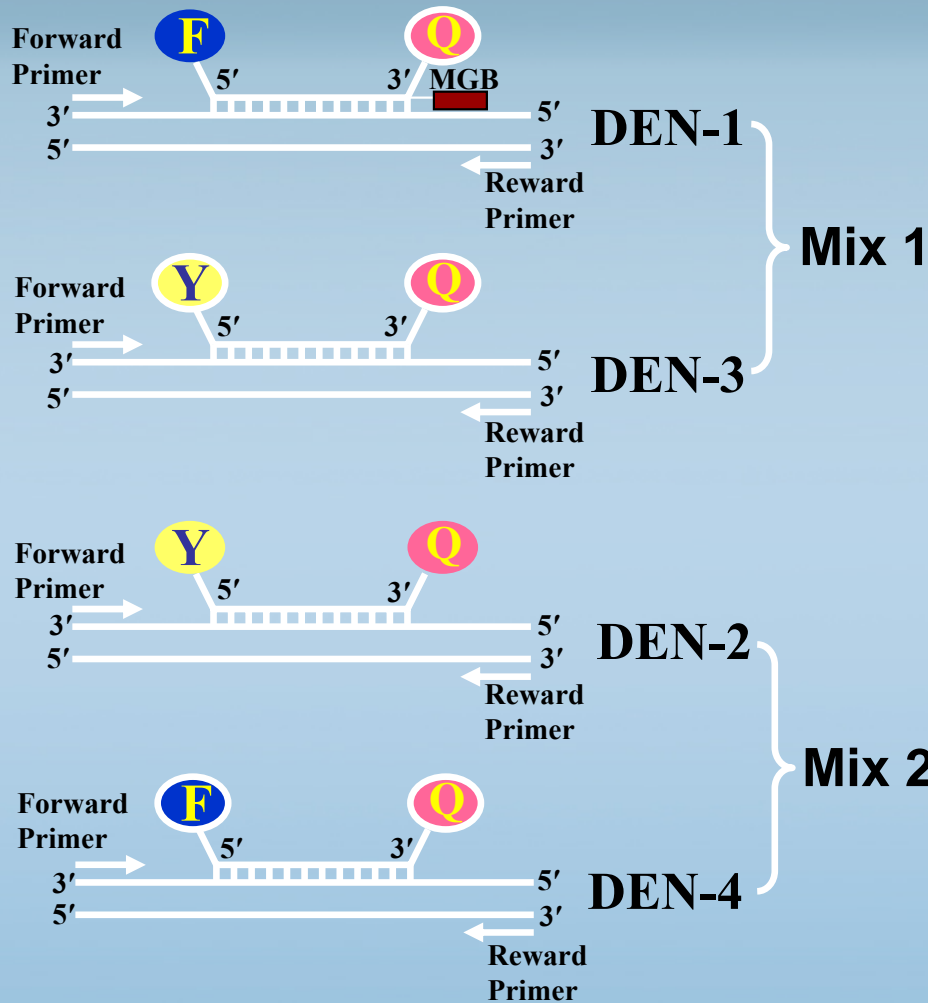

Cost

More sophisticated equipment

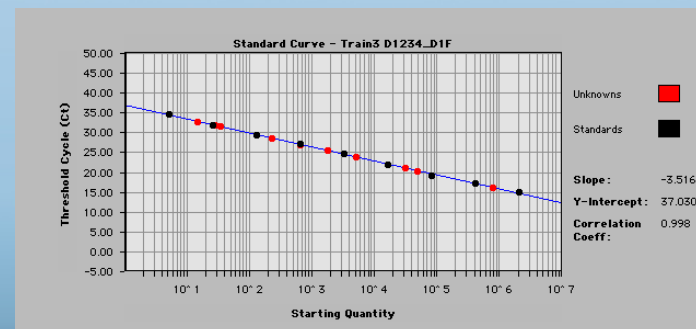

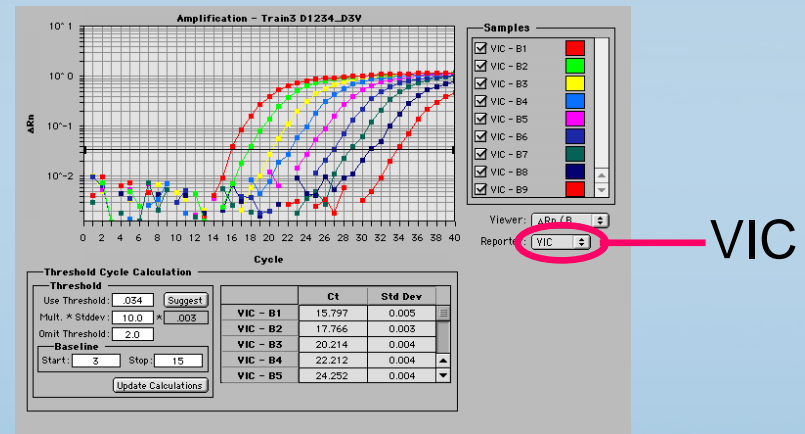

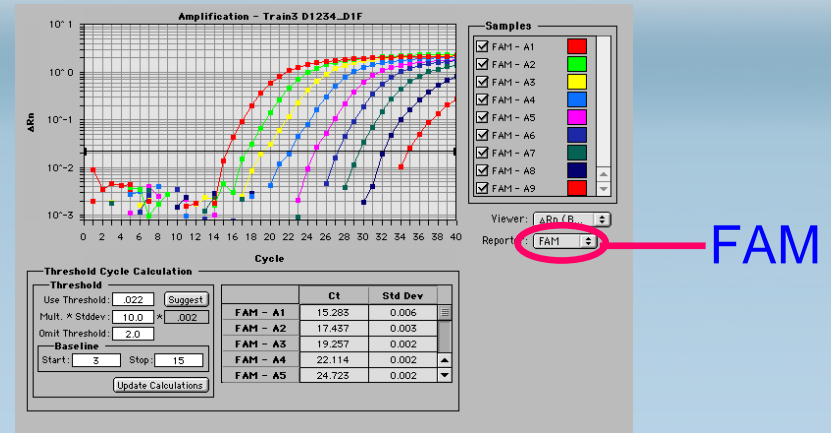

Dengue Quantitative Real-Time PCR

DEN 5'-noncoding region

F = FAM
Y = YAKIMA YELLOW
Q = Dark Quencher

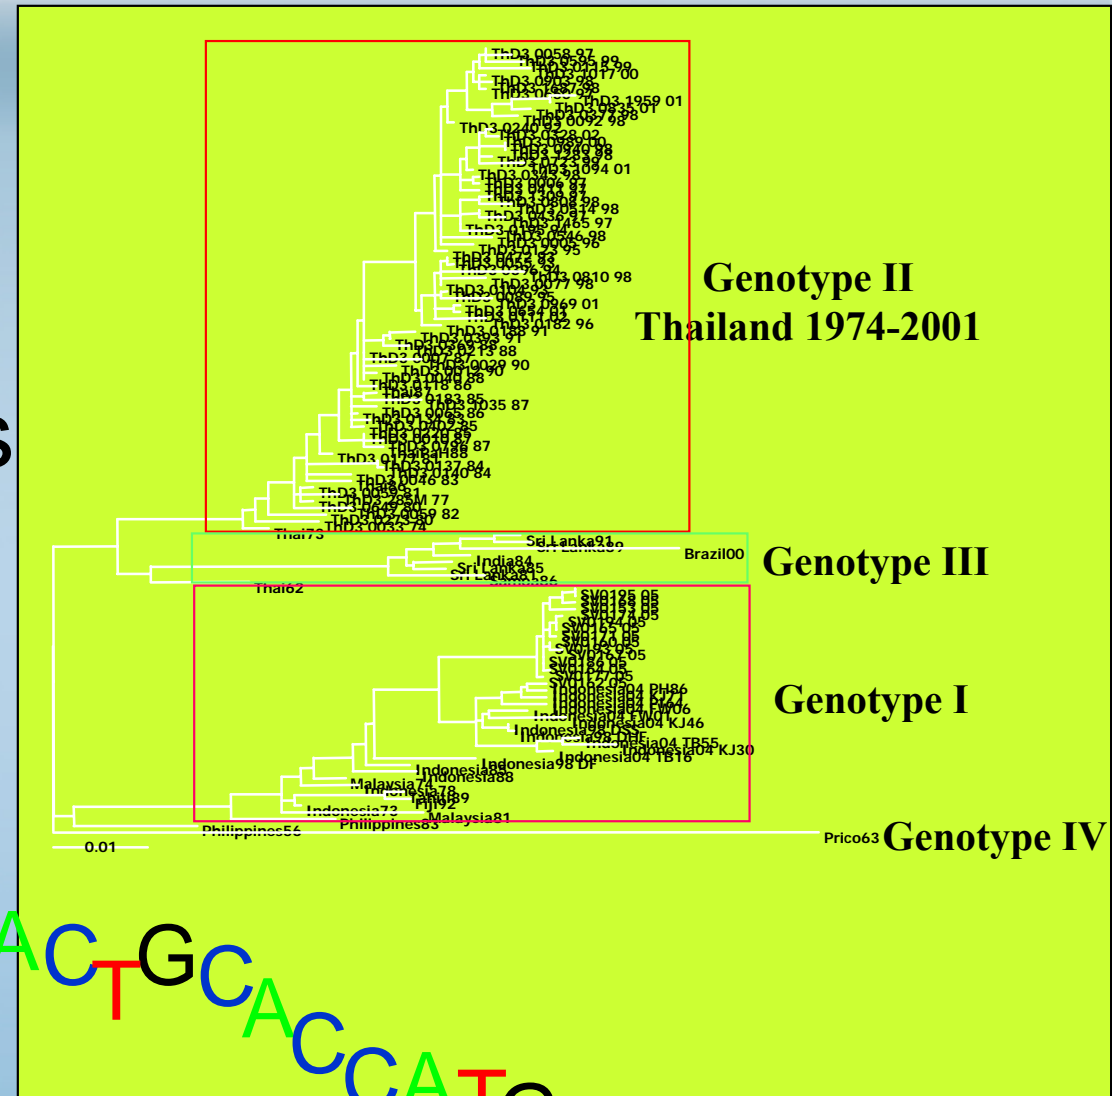

Detection of Dengue NS1 antigen

- Commercial NS1 Ag Detection Kits used at AFRIMS
- Commercial EIA and Rapid antigen are available but are not used in AFRIMS sponsored s

Genetic Sequencing

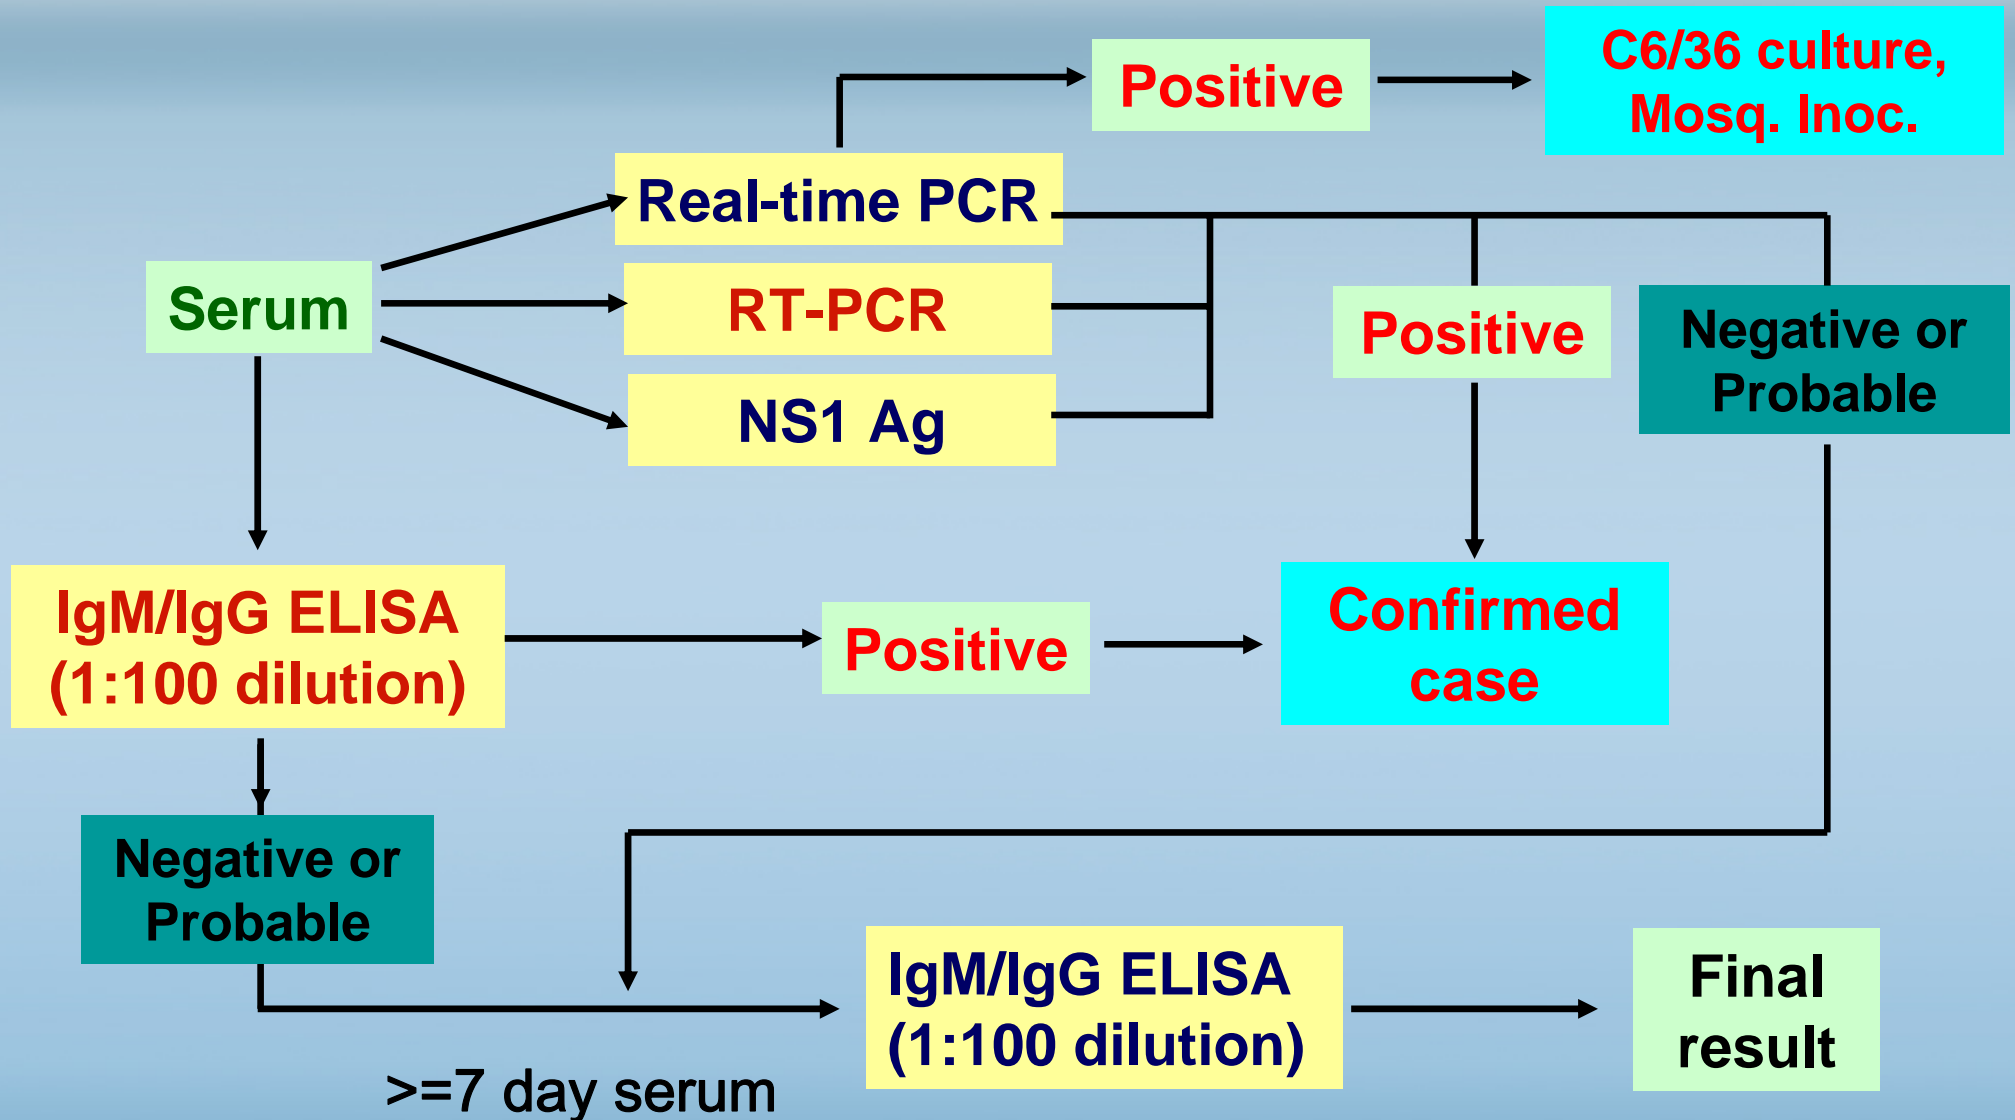

- Evolution Studies
- Genotyping
- Genetic Pathogenesis

AGTTACTGCACCATG

Flow Chart of Laboratory Diagnosis of Dengue Virus Infection
